PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
XX ubiquinone.
PS Disclosure; SEQ ID NO 4059; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a

CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of ubiquinone or
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

XX

PT Detecting nucleic acids having 2 portions e.g. for detecting disease,

PT comprises use of nanoparticles which have oligonucleotides attached to

PT them that are complementary to portions of the nucleic acid sequence.

XX

PS Example 18; Page 44; 130pp; English.

XX

CC This invention relates to a novel method for detecting a nucleic acid

CC having 2 portions. The method comprises providing nanoparticles having

CC oligonucleotides attached, where the oligonucleotide on each nanoparticle

CC has a sequence complementary to a sequence of 2 portions of nucleic acid.

CC The nucleic acid and nanoparticle are contacted to allow hybridisation of

CC the oligonucleotide on the nanoparticle with two or more portions of

CC nucleic acid and observing a detectable change brought about by the

CC hybridisation. The method of the invention is useful for separating a

CC selected nucleic acid having 2 portions, from other nucleic acids, and

CC for detecting nucleic acids having 2 portions. The method of the

CC invention is useful for detecting any type of nucleic acids which may be

CC used for diagnosis of disease and in sequencing of nucleic acids.

CC Preferably, the method is useful for detecting nucleic acids for

CC diagnosis and/or monitoring of viral diseases (human immunodeficiency

CC virus, hepatitis virus, herpes virus, cytomegalovirus and Epstein-Barr

CC virus), bacterial diseases, sexually transmitted diseases, inherited

CC disorders, in forensics, in DNA sequencing, for paternity testing, for

CC cell line authentication, for monitoring gene therapy, etc. This method

CC involves detecting nucleic acids based on observing a colour change with

CC the naked eye so is cheap, fast, simple and robust, and does not require

CC specialised expensive equipment. The present sequence represents a thiol

CC modified oligonucleotide sequence used to demonstrate the method of the

CC invention

PT Detection or quantification of nucleic acid analyte, by hybridizing a

PT nucleic acid probe having non-identical covalently attached dyes, with

PT nucleic acid analyte, and measuring change in fluorescence of the probes.

XX

PS Example 9; Page 32; 110pp; English.

XX

CC The present sequence is an example of nucleic acid probes of the

CC invention. The probe may be doubly labelled with non-identical covalently

CC attached dyes, e.g. the fluorescent intercalator ethidium, which serves as

CC as the detector dye and the fluorescent dye fluorescein, which serves as

CC the donor dye of a fluorescent resonance energy transfer (FRET) system. A

CC bifunctional linker was used to attach the dyes to the oligonucleotide.

CC The probe generates a fluorescent signal upon hybridisation to a

CC complementary nucleic acid based on the interaction of the intercalator

CC with the formed double-stranded DNA. Nucleic acid probes of the invention

CC can be used in homogeneous assays, real-time PCR monitoring,

CC transcription assays, expression analysis on nucleic acid microarrays and

CC other microarray applications such as genotyping

PT Preparing internucleotide phosphorothioate linkage enhanced in Sp/Rp

PT enantiomer, by coupling a synthon with 2'-substituted nucleoside in

PT presence of coupling agent having a pKa that enhances linkage in Sp/Rp

PT enantiomer.

XX

PS Example 1; Page 31; 65pp; English.

XX

CC The present invention describes a method (M1) for preparing an

CC internucleotide phosphorothioate linkage enriched in the Sp or Rp

CC enantiomer between a synthon having a hydroxyl moiety at the 5' position

CC and a 2'-substituted nucleoside having an activated phosphate moiety at

CC the 3'-position, comprising coupling a synthon with a 2'-substituted
CC nucleoside in the presence of coupling agent that is selected to enhance
CC either the Rp or Sp enantiomer according to its pKa. This method is
CC useful for preparing an oligonucleotide having at least one region of
CC internucleotide linkages that is enhanced in the Sp or Rp enantiomer,
CC which involves providing a nucleotide having a hydroxyl moiety at the 5'-
CC position or a growing oligonucleotide chain having a hydroxyl moiety at
CC the 5'-position, coupling the nucleotide or growing oligonucleotide chain
CC to a 2'-substituted nucleoside having an activated phosphate moiety at
CC the 3' position in the presence of the coupling agent, and repeating the
CC coupling step until the desired number of linkages is established. The
CC oligonucleotide having a region of internucleotide linkages that is
CC enhanced in the Sp enantiomer is further processed to include another
CC region of internucleotide linkages that is enhanced in the Sp and/or Rp
CC enantiomer. Oligonucleotides prepared by the method lead to improved
CC drugs, diagnostics and research reagents. The present sequence represents
CC an oligonucleotide used in the exemplification of the present invention

Pharmaceutical composition for treating asthma, has antisense
oligonucleotide containing less percentage of adenosine, targeted to
nucleic acids associated with lung airway or lung dysfunction, and
bronchodilating agent.
XX
PS Claim 15; SEQ ID NO 3509; 763pp; English.
XX
CC This invention describes a novel composition (a) a first active agent,

CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

XX
XX Pharmaceutical composition for treating asthma, has antisense
PT oligonucleotide containing less percentage of adenosine, targeted to
PT nucleic acids associated with lung airway or lung dysfunction, and
PT bronchodilating agent.
XX
PS Claim 15; SEQ ID NO 554; 763pp; English.
XX
CC This invention describes a novel composition (a) a first active agent,
CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic, is a
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

XX Pharmaceutical composition for treating asthma, has antisense

PT oligonucleotide containing less percentage of adenosine, targeted to

PT nucleic acids associated with lung airway or lung dysfunction, and

PT bronchodilating agent.

XX Claim 15; SEQ ID NO 4483; 763pp; English.

PS This invention describes a novel composition (a) a first active agent,

XX comprising oligonucleotides, effective for alleviating

CC bronchoconstriction, respiratory tract inflammation, allergies and

CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,

CC surfactant depletion or hyoposecretion, when administered to a mammal. The

CC oligonucleotides are derived from a gene encoding or regulating

CC expression of a target polypeptide associated with lung airway or lung

CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.

CC The invention also describes a kit, that comprises: (a) a delivery

CC device, in separate containers, (b) the oligonucleotides, (c)

CC instructions for adding a carrier and for use of the kit. The composition

CC of the invention has antiallergic, antiinflammatory, antiasthmatic, is a

CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a

CC beta-adrenergic agonist. The composition is useful for preventing or

CC treating a respiratory, lung or malignant disease. The administered

CC composition comprises oligo and is administered to reduce the production

CC or availability, or to increase the degradation of the target mRNA or to

CC reduce the amount of target polypeptide present in the lungs. The

CC pulmonary obstruction, and/or bronchoconstriction and/or lung

CC inflammation, allergies and/or surfactant hypoproduction are associated

CC with a disease or condition such as pulmonary vasoconstriction,

CC inflammation, allergies, asthma, impeded respiration, respiratory

CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary

CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary

CC transplantation rejection, pulmonary infections, bronchitis or cancer.

CC The reduced adenosine content of the anti-sense oligos corresponding to

CC thymidines present in the target RNA serves to prevent the breakdown of

CC the oligonucleotides into products that free adenosine into the system

CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to

CC prevent any unwanted effects due to it

XX Pharmaceutical composition for treating asthma, has antisense
PT oligonucleotide containing less percentage of adenosine, targeted to
PT nucleic acids associated with lung airway or lung dysfunction, and
PT bronchodilating agent.
XX
PS Claim 15; SEQ ID NO 553; 763pp; English.
XX This invention describes a novel composition (a) a first active agent,
CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypextension, emphysema, chronic obstructive pulmonary disease, cancer.
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

XX
CC This invention describes a novel composition (a) a first active agent,
CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic, is a
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, cancer.
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

XX Amplifying for RNA in a sample, useful for improving RNA polymerase based
PT RNA transcription from a polynucleotide template, comprises eliminating
PT single-stranded oligonucleotide from the transcription sample.
XX
XX Example 2; SEQ ID NO 11; 26pp; English.
XX
XX The invention relates to amplifying for RNA in a sample comprises
CC eliminating single-stranded oligonucleotide from the transcription
CC sample. The method involves synthesizing single-stranded cDNA by
CC incubating the sample RNA with reverse transcriptase and an
CC oligonucleotide primer that primes synthesis in a direction toward 5' end
CC of the RNA; converting the single-stranded cDNA into double-stranded cDNA
CC to form a transcription sample containing a cDNA template; eliminating
CC single-stranded oligonucleotide from the transcription sample; and
CC transcribing the cDNA template into RNA using an RNA polymerase. The
CC method is useful for improving RNA polymerase based RNA transcription
CC from a polynucleotide template. The method inhibits the undesired non-
CC template derived production of RNA in the transcription reaction. The
CC present sequence represents an oligonucleotide used to exemplify RNA
CC transcription in the presence of single- and double-stranded
CC oligonucleotides.

XX Analysis of sample molecules such as DNA fragment, by using micro channel
PT to form laminar flow of specimen molecule-containing solution and complex
PT forming molecule containing solution.
XX
PS Example 1; Page 9; 19pp; Japanese.
XX
XX The invention relates to a novel method involving forming a laminar flow,
CC by passing into a micro channel, a solution containing the specimen
CC molecules, and a solution containing probe molecules capable of forming a

CC complex with the specimen molecules. The dispersion of the formed complex
CC is selectively promoted, based on their affinity, and the degree of
CC dispersion of the complex formed between the specimen molecules and the
CC probe molecules is detected and analysed. The probe molecules are capable
CC of producing fluorescence. This polynucleotide sequence represents an
CC oligo used in the exemplification of the invention.

PT Novel polyalkyleneamine-containing oligomeric compound useful for
PT preventing or delaying infection, inflammation or tumor formation in
PT organisms.
XX
PS Example 3; Page 22; 37pp; English.
XX
XX The invention relates to a polyalkyleneamine-containing oligomeric
CC compound (OC). Also described is a compound (C) comprising an oligomeric
CC part, a fusogenic part, and a targeting part; and enhancing the cellular
CC uptake of OC, by conjugating OC to a fusogenic part. In (C), the
CC fusogenic part is covalently linked to the oligomeric part. The targeting
CC part is covalently linked to the oligomeric or fusogenic part, where the
CC fusogenic part is a lipophilic polyamine, polyethylenimine,
CC polyallylamine, fusogenic peptide, oligomeric imidazole, histidine,
CC pyridine, hydroxylamine, substituted hydroxylamine, hydrazine,

CC substituted hydrazine, thiourea or imine. The targeting part is a ligand
CC that binds to a cellular reporter, where the targeting part is
CC transferrin, folate, epidermal growth factor, nerve growth factor,
CC insulin, alpha-fetoprotein, galactose, galactosamine, lactose, mannose, a
CC polyclonal antibody, monoclonal antibody, vitamin B12, ibuprofen,
CC cholesterol, low-density lipoprotein, peptide comprising an arginine-
CC glycine-aspartic acid sequence. The oligomeric part is an
CC oligonucleotide, and oligonucleotide analogue, a peptide nucleic acid or
CC a peptide nucleic acid analogue. OC is useful as a prodrug, useful in
CC diagnostics, therapeutics and as research reagents and kits. OC is useful
CC for preventing or delaying infection, inflammation or tumour formation in
CC organisms. The present sequence represents an oligonucleotide used in the
CC method of the invention.

XX PS Claim 2; SEQ ID NO 1791; 85pp; English.

XX The present invention relates to an oligonucleotide anti-sense to e.g.,
CC initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-
CC end of nucleic acid target comprising gene(s) chosen from e.g.
CC interleukin (IL)-4 receptor, IL-5 receptor or salts of the
CC oligonucleotide and optionally surfactant operatively linked to the
CC oligonucleotide. The method is useful for preventing or treating a
CC respiratory or lung disease, which involves administering to the airways
CC of a subject an effective amount of an inhibitor. The oligonucleotide is

CC useful for production of a medicament for the prevention and/or treatment
CC of a respiratory or lung disease. The respiratory or lung disease is
CC chosen from airway inflammation, allergy(ies), asthma, impeded
CC respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases
CC (COPD), allergic rhinitis (AR), acute respiratory distress syndrome
CC (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway
CC obstruction. The present sequence represents an oligonucleotide of the
CC invention.

XX Detection of nucleic acid, e.g. viral RNA or DNA, comprises contacting
PT nucleic acid with different types of nanoparticles having attached
PT oligonucleotides and observing detectable change brought about by

PT hybridization.
PS Example 24; SEQ ID NO 70; 206pp; English.
XX
CC The invention relates to a novel method for detecting a nucleic acid
CC having at least two portions comprising contacting the nucleic acid with
CC at least two types of nanoparticles, such as gold, having attached
CC oligonucleotides and observing a detectable change brought about by
CC hybridisation of the oligonucleotides on the nanoparticles with the
CC nucleic acid. The method of the invention may be useful for detecting a
CC nucleic acid, preferably viral RNA or DNA, bacterial DNA, a gene
CC associated with a disease, a fungal DNA, synthetic DNA or RNA,
CC structurally modified natural or synthetic DNA or RNA or a product of a
CC polymerase chain reaction amplification. The detected nucleic acid may be
CC utilised for diagnosis of disease, sequencing of nucleic acids,
CC forensics, paternity testing, cell line authentication and monitoring
CC gene therapy. The method for detecting the nucleic acids is based on
CC observing a colour change with the naked eye and is cheap, fast, simple,
CC and robust, requiring no specialised or expensive equipment. The current
CC sequence is that of the oligonucleotide which is related to a thiol-
CC modified oligonucleotide-gold colloid conjugate probe of the invention.

CC The present invention relates to a method (M1) for detecting and/or
CC isolating a nucleic acid having a homopolymeric sequence or repetitive
CC element or conserved nucleotide sequence. (M1) comprises treating a
CC sample containing nucleic acid compounds with an locked nucleic acid
CC (LNA) oligonucleotide (LO) to thereby detect and/or isolate a nucleic
CC acid having the homopolymeric sequence or repetitive element or conserved
CC nucleotide sequence. (M1) is useful for detecting and isolating nucleic
CC acids released from a lysed complex biological mixture comprising nucleic
CC acids. The present sequence is a LNA oligomer, used to illustrate the
CC invention.

PT New antisense compound, having a sequence targeted to a nucleic acid
PT encoding MPGES-1, useful for preparing a composition for treating e.g.,
PT inflammation, Alzheimer's disease, arthritis, diabetes, cancer or
PT ischemia.

PS Claim 4; SEQ ID NO 184; 132pp; English.

XX The present sequence represents a chimeric antisense oligonucleotide
CC targeted to human microsomal prostaglandin E2 synthase (MPGES-1). The
CC human MPGES-1 gene is located on chromosome 9, more specifically to
CC 9q34.3. The present invention also describes: (1) antisense compounds,
CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding
CC MPGES-1, which specifically hybridise with the nucleic acid MPGES-1 and
CC inhibits its expression; (2) a method of inhibiting the expression of
CC MPGES-1 in cells or tissues; and (3) a method of treating an animal
CC having a disease or condition associated with MPGES-1. MPGES-1 chimeric
CC antisense oligonucleotides and antisense compounds have cytostatic,
CC antiinflammatory, immunomodulator, cardiant, neuroprotective,
CC ophthalmological, immunomodulatory and cardiovascular activities, and can
CC be used as MPGES-1 inhibitors and in gene therapy. The antisense compound
CC can be used for preparing a composition for treating a disease or
CC condition associated with MPGES-1 e.g., inflammation, Alzheimer's
CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
CC ophthalmic, immunological, cardiovascular or neurological disorder.

PS Claim 4; SEQ ID NO 201; 132pp; English.
XX
CC The present sequence represents a chimeric antisense oligonucleotide
CC targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The
CC human mPGES-1 gene is located on chromosome 9, more specifically to
CC 9q34.3. The present invention also describes: (1) antisense compounds,
CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding
CC mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and
CC inhibits its expression; (2) a method of inhibiting the expression of
CC mPGES-1 in cells or tissues; and (3) a method of treating an animal
CC having a disease or condition associated with mPGES-1. mPGES-1 chimeric
CC antisense oligonucleotides and antisense compounds have cytostatic,
CC antidiabetic, immunomodulator, cardiant, neuroprotective,
CC antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic,
CC ophthalmological, immunomodulatory and cardiovascular activities, and can
CC be used as mPGES-1 inhibitors and in gene therapy. The antisense compound
CC can be used for preparing a composition for treating a disease or
CC condition associated with mPGES-1 e.g., inflammation, Alzheimer's
CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
CC ophthalmic, immunological, cardiovascular or neurological disorder.

XX
PS Claim 4; SEQ ID NO 427; 132pp; English.
XX
CC The present sequence represents a chimeric antisense oligonucleotide
CC targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The
CC human mPGES-1 gene is located on chromosome 9, more specifically to
CC 9q34.3. The present invention also describes: (1) antisense compounds,
CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding
CC mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and
CC inhibits its expression; (2) a method of inhibiting the expression of
CC mPGES-1 in cells or tissues; and (3) a method of treating an animal
CC having a disease or condition associated with mPGES-1. mPGES-1 chimeric
CC antisense oligonucleotides and antisense compounds have cytostatic,
CC antidiabetic, immunomodulator, cardiant, neuroprotective,
CC antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic,
CC ophthalmological, immunomodulatory and cardiovascular activities, and can
CC be used as mPGES-1 inhibitors and in gene therapy. The antisense compound
CC can be used for preparing a composition for treating a disease or
CC condition associated with mPGES-1 e.g., inflammation, Alzheimer's
CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
CC ophthalmic, immunological, cardiovascular or neurological disorder.

CC The present sequence represents a chimeric antisense oligonucleotide
CC targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The
CC human mPGES-1 gene is located on chromosome 9, more specifically to
CC 9q34.3. The present invention also describes: (1) antisense compounds,
CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding
CC mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and
CC inhibits its expression; (2) a method of inhibiting the expression of
CC mPGES-1 in cells or tissues; and (3) a method of treating an animal
CC having a disease or condition associated with mPGES-1. mPGES-1 chimeric
CC antisense oligonucleotides and antisense compounds have cytosstatic,
CC antidiabetic, immunomodulatory, cardiant, neuroprotective,
CC antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic,
CC ophthalmological, immunomodulatory and cardiovascular activities, and can
CC be used as mPGES-1 inhibitors and in gene therapy. The antisense compound
CC can be used for preparing a composition for treating a disease or
CC condition associated with mPGES-1 e.g., inflammation, Alzheimer's
CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or

CC ophthalmic, immunological, cardiovascular or neurological disorder.

CC 9q34.3. The present invention also describes: (1) antisense compounds,
CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding
CC mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and
CC inhibits its expression; (2) a method of inhibiting the expression of
CC mPGES-1 in cells or tissues; and (3) a method of treating an animal
CC having a disease or condition associated with mPGES-1. mPGES-1 chimeric
CC antisense oligonucleotides and antisense compounds have cytostatic,
CC antidiabetic, immunomodulator, cardiant, neuroprotective,
CC antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic,
CC ophthalmological, immunomodulatory and cardiovascular activities, and can
CC be used as mPGES-1 inhibitors and in gene therapy. The antisense compound
CC can be used for preparing a composition for treating a disease or
CC condition associated with mPGES-1 e.g., inflammation, Alzheimer's
CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
CC ophthalmic, immunological, cardiovascular or neurological disorder.

CC The present sequence represents a chimeric antisense oligonucleotide
CC targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The
CC human mPGES-1 gene is located on chromosome 9, more specifically to
CC 9q34.3. The present invention also describes: (1) antisense compounds,
CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding
CC mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and
CC inhibits its expression; (2) a method of inhibiting the expression of
CC mPGES-1 in cells or tissues; and (3) a method of treating an animal
CC having a disease or condition associated with mPGES-1. mPGES-1 Chimeric
CC antisense oligonucleotides and antisense compounds have cytostatic,
CC antidiabetic, immunomodulator, cardiant, neuroprotective,
CC antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic,
CC ophthalmological, immunomodulatory and cardiovascular activities, and can
CC be used as mPGES-1 inhibitors and in gene therapy. The antisense compound
CC can be used for preparing a composition for treating a disease or
CC condition associated with mPGES-1 e.g., inflammation, Alzheimer's
CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
CC ophthalmic, immunological, cardiovascular or neurological disorder.

XX
CC The invention relates to oligonucleotides anti-sense to an initiation
CC codon, coding region, 5' or 3' intron-exon junction, intron or region
CC with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target
CC chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)
CC -5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM,
CC triptase a, triptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention
CC also relates to a method of screening a candidate compound that binds to
CC one or more nucleic acid target(s) or expressed product(s), for the
CC prevention and/or treatment of a respiratory or lung disease. The
CC oligonucleotides are useful for reducing or inhibiting expression of a
CC gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor,
CC CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, triptase a,
CC triptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are
CC useful for preventing or treating a respiratory or lung disease. The
CC respiratory or lung disease is associated with hyper-responsiveness to
CC and/or increased levels of, adenosine and/or levels of adenosine A
CC receptor(s), and/or asthma and/or lung allergies associated with
CC inflammation or an inflammatory disease. The respiratory or lung disease
CC is chosen from airway inflammation, allergy, asthma, impeded respiration,
CC cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD),
CC allergic rhinitis, acute respiratory distress syndrome, pulmonary
CC hypertension, lung inflammation, bronchitis, airway obstruction or
CC bronchoconstriction. This sequence represents an oligonucleotide of the
CC invention.

XX New library of polynucleotide sequences expressed in cells from synovial
PT tissues, useful for diagnosing and treating rheumatoid arthritis or
PT osteoarthritis.
XX
PS Disclosure; SEQ ID NO 5; 71pp; English.
XX
CC The present invention concerns an analysis of genes differentially
CC expressed in synovial tissues from rheumatoid arthritis (RA) and
CC osteoarthritis (OA) patients. Microarray technology was used to compare
CC gene expression profiles, and sets of genes were identified based on over
CC -expression or under-expression in RA samples compared to OA samples.
CC Results for 6 of the selected genes (GBPI,CLU, RH70, GLO1, DXS and CTSL)
CC were verified by real-time, quantitative PCR using samples identical to
CC those used in the microarray experiments and also entirely separate
CC samples. The present sequence is that of a forward PCR primer for CLU; a
CC reverse primer is also provided ADO07106. CLU was shown to be under-
CC expressed in RA relative to OA samples. The invention provides libraries
CC and arrays of polynucleotide sequences useful for prognosticating or
CC diagnosing RA or OA. Methods are also provided for following the
CC efficiency of a treatment against RA or OA, and for screening potential
CC therapeutic agents for treating RA or OA.

PT specific binding member.
XX
PS Disclosure; SEQ ID NO 31; 55pp; English.
XX
CC The invention describes a reagent (I) comprising a particle bound to at
CC least one Raman label and a specific binding member, where the Raman

CC label can be activated to provide a surface-enhanced Raman scattering
CC (SERS) effect or comprising a specific binding member having two or more
CC different Raman labels bound to it. Also described are: a test kit (II),
CC comprising (I) in one container and a silver, gold or copper Raman
CC enhancer stain in another container; and a fibre optic detection device
CC (III), having a bundle of optical fibres terminating with ends of the
CC optical fibre, where a several of the optical fibres have (I) located at
CC the ends of the optical fibre. (I) is useful for: detecting for the
CC presence or absence of one or more target analytes in a sample, the
CC target analytes having at least two binding sites; detecting the presence
CC or absence of one or more target nucleic acid in a sample, the sequence
CC of the nucleic acid having at least two portions; and for screening one
CC or more molecules to determine whether the molecule is a ligand to one or
CC more specific receptors. This sequence represents an oligonucleotide
CC associated with the SERS-based detection analyte detection method.

PT Isolating molecules e.g., DNA, by introducing solution with two types of
PT solute molecules into micro flow path to form non turbulent flow,
PT providing physical action to molecule causing difference in flow
PT behavior, separating molecules.
XX
PS Example 3; Page 7; 19pp; Japanese.
XX

CC The invention relates to a novel method for isolating molecules using a
CC micro-channel. The molecules are isolated by introducing a mixed solution
CC having two types of solute molecules differing in molecular weight into a
CC micro flow path, to form a non turbulent flow, and providing physical
CC action to the molecules by changing the flow state, thus causing
CC different behaviours among different solute molecules, where the
CC different behaviour enables uneven distribution of specific kinds of
CC molecules in the flow path, causing separation of the molecules. The
CC invention further comprises: molecule separation apparatus, comprising a

CC substrate with a micro flow path, having one or more curved portions, a
CC sample intake unit at one side and a sample removal opening at the other
CC side, and a physical property detection sensor arranged inside the curved
CC portion or outside the curved portion. The method is useful for isolating
CC molecules, e.g. polymer compounds, DNA or proteins. The method enables
CC simple and efficient separation of molecules by utilising specific flow
CC behaviour in a non turbulent flow, in a micro flow path, where a large
CC number of samples can be processed. This polynucleotide sequence
CC represents an oligo used in the exemplification of the invention.

PT Analysis of cDNA and gene expression - by amplification of mRNA followed
PT by digestion with restriction enzymes.
XX
PS Disclosure; Page 8; 11pp; Japanese.
XX
CC A method for the analysis of cDNA comprises (a) preparing an aggregate of
CC double-stranded cDNAs by using an aggregate of mRNAs and a plural type of
CC labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)
CC and using the aggregate of mRNAs as the template for each reverse
CC transcription primer; (b) digesting each of the prepared aggregates of
CC the double-stranded cDNAs with restriction enzyme and; (c)
CC electrophoresing the digested aggregate of cDNAs in separate lanes. The
CC method can be used to analyse gene expression rapidly and easily

PT New self-addressable electronic devices - used for multi-step and
PT multiplex reactions such as DNA hybridisation(s), clinical diagnostics
PT and bio:polymer synthesis.
XX
PS Example 1; Page 40; 86pp; English.
XX
CC The sequences represented by, AAQ90390-90401 are synthetic DNA probes
CC containing 3' ribonucleoside termini. The sequences shown in AAQ90402-15

CC are synthetic DNA probes with 5' amino termini. These sequences were
CC specific for the polymorphisms of HLA gene dQa. The sequences were used
CC in the device of the invention. This is a self-addressable electronic
CC device (SAED) that can be used to carry out multi-step and multiplex
CC reactions, such as nucleic acid hybridisations. The advantages of this
CC method are that these reactions can be carried out with complete and
CC precise electronic control, and that the rate, specificity and
CC sensitivity of these reactions are greatly improved at micro-locations

PT e.g. nucleic acid hybridisation.
XX
PS Example 1; Page 60; 155pp; English.
XX
CC The sequences given in AAT10742-67 are synthetic oligonucleotides which
CC are used in the construction of the electronically self- addressable
CC device (ED) of the invention. The ED comprises a substrate, an electrode
CC or opt. a number of electrodes supported by the substrate, a current
CC source operatively connected to the electrode and an attachment layer
CC adjacent to the electrode which is permeable to a counterion but not
CC permeable to a molecule capable of insulating or binding to the
CC electrode. The attachment layer is capable of attaching a macromolecule.
CC The ED is used for genetic typing and comprises a number of
CC electronically addressable locations each comprising an electrode, and a
CC binding entity, such as one of these probes, attached to each of the
CC locations capable of detecting the presence of a genetic sequence

PT	New microelectronic device designed to carry out and control multi-step									
PT	and multiplex molecular biological reactions in microscopic format.									
XX										
PS	Example 1; Page 89; 179pp; English.									
XX										
CC	The specification describes a self-addressable, self-assembling									
CC	microelectronic device which is designed to actively carry out and									
CC	control multi-step and multiplex molecular biological reactions in									
CC	microscopic formats. A key aspect of this inventions is played by the ion									
CC	-permeable permeation layer which overlies the electrode. This permeation									
CC	layer allows attachment of nucleic acids to permit immobilization but									
CC	also separates the attached oligonucleotides and hybridized target DNA									
CC	sequences from the highly reactive electrochemical environment generated									
CC	immediately at the electrode surface. The microelectronic device is									
CC	designed and fabricated to actively carry out and control reactions such									
CC	as nucleic acid hybridizations, antibody/antigen reactions, sample									
CC	preparation, diagnostics and biopolymer synthesis. The device can									
CC	electronically control the transport and attachment of specific binding									
CC	entities, such as nucleic acids and polypeptides, to specific micro-									
CC	locations. The device can subsequently control the transport and reaction									
CC	of analytes or reactants at the addressed specific micro-locations. The									
CC	device is able to concentrate analytes and reactants, remove non-									
CC	specifically bound molecules, provide stringency control for DNA									
CC	hybridization reactions and improve the detection of analytes. The									
CC	present sequence represents a probe used to exemplify the invention

PT	Sorting single-stranded nucleic acid, useful for analyzing expression			
PT	patterns and screening active agents, uses capture agent with variable			
PT	and constant regions.			
XX				
PS	Example; Page 5; 8pp; German.			
XX				
CC	This invention describes a novel method for sorting single-stranded			
CC	nucleic acids by isolation and hybridisation of nucleic acid pools, then			
CC	reading out, where the nucleic acids are selectively bound using capture			
CC	agents that are (a) immobilised on the surface of a solid matrix and (b)			
CC	comprise variable and non-variable regions. The capture oligonucleotides			
CC	have a 5'-invariable anchor region, the complement of which is present at			
CC	least once in each nucleic acid and a 3'-variable, discriminatory region			
CC	that comprises all possible combinations of up to 10 nucleotides to allow			
CC	binding of particular sorts of single stranded nucleic acids. The capture			
CC	agents are particularly locked nucleic acids (LNA) and the anchor region			
CC	comprises a sequence of 10-50, particularly 15-25, T residues. The			
CC	capture oligonucleotides are biotinylated and immobilised on a surface by			
CC	interaction with streptavidin. The matrix is of plastic, ceramic, glass,			
CC	metal, resin, gel, crystalline material and/or membrane, having semi-			
CC	conducting properties and especially in the form of a chip. Its surface			
CC	is particularly a layer of (bio)molecular filaments and binding of single			
CC	stranded nucleic acids to the surface is (quasi)covalent, supramolecular,			
CC	physical, stimulated by an electrical field or through a molecular sieve.			
CC	The method is used (i) for analysis of patterns, especially in mucosal,			
CC	hair root, blood, nerve or germ cells and (ii) for determining the			
CC	activity of pharmaceuticals and/or nutritional compounds, e.g. food			
CC	additives or supplements, especially minerals, trace elements, organic			
CC	acids (amino, carboxylic or fatty acid) or their derivatives, salts and			
CC	mixtures. The method provides rapid, inexpensive and reproducible			
CC	representation of differences in pools of nucleic acids from cells. It			
CC	allows imaging of the complete pattern of all nucleic acid in a cell, and			
CC	can detect very small differences in the nucleic acid pool. Since the			
CC	method is based on comparison of nucleic acid pools, not individual			
CC	genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent			

CC capture probes used in the method of the invention.

PT Sorting single-stranded nucleic acid, useful for analyzing expression
PT patterns and screening active agents, uses capture agent with variable
PT and constant regions.
XX
PS Example; Page 6; 8pp; German.
XX
CC This invention describes a novel method for sorting single-stranded
CC nucleic acids by isolation and hybridisation of nucleic acid pools, then
CC reading out, where the nucleic acids are selectively bound using capture
CC agents that are (a) immobilised on the surface of a solid matrix and (b)
CC comprise variable and non-variable regions. The capture oligonucleotides
CC have a 5'-invariable anchor region, the complement of which is present at
CC least once in each nucleic acid and a 3'-variable, discriminatory region
CC that comprises all possible combinations of up to 10 nucleotides to allow
CC binding of particular sorts of single stranded nucleic acids. The capture

CC agents are particularly locked nucleic acids (LNA) and the anchor region
CC comprises a sequence of 10-50, particularly 15-25, T residues. The
CC capture oligonucleotides are biotinylated and immobilised on a surface by
CC interaction with streptavidin. The matrix is of plastic, ceramic, glass,
CC metal, resin, gel, crystalline material and/or membrane, having semi-
CC conducting properties and especially in the form of a chip. Its surface
CC is particularly a layer of (bio)molecular filaments and binding of single
CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular,
CC physical, stimulated by an electrical field or through a molecular sieve.
CC The method is used (i) for analysis of patterns, especially in mucosal,
CC hair root, blood, nerve or germ cells and (ii) for determining the
CC activity of pharmaceuticals and/or nutritional compounds, e.g. food
CC additives or supplements, especially minerals, trace elements, organic
CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and
CC mixtures. The method provides rapid, inexpensive and reproducible
CC representation of differences in pools of nucleic acids from cells. It
CC allows imaging of the complete pattern of all nucleic acid in a cell, and
CC can detect very small differences in the nucleic acid pool. Since the
CC method is based on comparison of nucleic acid pools, not individual
CC genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent
CC capture probes used in the method of the invention.

PT Pharmaceutical composition for treating asthma, has antisense
PT oligonucleotide containing less percentage of adenosine, targeted to
PT nucleic acids associated with lung airway or lung dysfunction, and
PT bronchodilating agent.
XX
PS Claim 15; SEQ ID NO 4920; 763pp; English.
XX
CC This invention describes a novel composition (a) a first active agent,
CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

PT
XX Disclosure; Page 20; 42pp; English.
XX
CC Achiral linker reagents have been developed for the incorporation of
CC multiple amino groups into oligonucleotides. The present sequence
CC represents a modified oligodeoxyribonucleotide. The achiral linker
CC reagents can be used for incorporation of multiple primary amino groups
CC or reporter groups into oligonucleotides. They are compatible with
CC conventional DNA synthesis following the phosphoramidite methodology, and
CC can be incorporated in good yields. The linker reagents may be used for
CC labelling of oligonucleotides. They may also be used for preparation of
CC oligonucleotides, e.g. for use as hybridisation probes, for use as
CC primers in the polymerase chain reaction or in nucleic acid sequencing
CC reactions, for production of affinity matrices for purification of DNA
CC binding proteins or other biomolecules, for production of affinity
CC matrices for detection of nucleic acid sequences, for cloning recombinant
CC DNA or for in-vitro mutagenesis

PT Nucleic acid assay methods - based on restriction fragment length
PT determination.
XX
PS Example 1; Page 7; 21pp; English.
XX
CC The present sequence is a DNA probe used in a novel method of analysis or
CC assay for nucleotides, which comprises: (i) digesting DNA with a
CC restriction enzyme; (ii) discriminating a difference in sequences of the
CC DNA fragments obtained around the 3' termini with a DNA probe and
CC extending the DNA probe by a complementary strand synthesis to
CC fractionate the DNA fragments into groups; and (iii) measuring lengths of
CC the DNA fragments which belong to the groups, or length of the extended
CC DNA probe, and using the lengths obtained for the fragments around the 3'
CC termini as fingerprints. Where polyA is present, the presence of
CC recognition sequence GCG is critical for clarifying the terminal site,
CC this is because the length of polyA cannot be controlled. The method is
CC useful for assaying a large number of cDNA molecules or DNA fragments and
CC for assaying long DNA sequences

XX PT melanoma.
XX PS Disclosure; Fig 3; 139pp; English.
XX PT
XX CC This invention relates to novel immunostimulatory oligonucleotides that
XX CC contain a non-palindromic sequence motif. Specifically, it refers to DNA
XX CC oligonucleotides (without a CpG motif), which can stimulate an immune
XX CC response in animals of the order of primate, including humans. The immune
XX CC response is characterised by the proliferation, differentiation, cytokine
XX CC and antibody production in B-cells, as well as cell differentiation and
XX CC cytokine production in plasmacytoid dendritic cells. The present
XX CC invention describes immunomodulator compositions that also comprise an
XX CC antigen selected from, for example, viruses, bacteria, parasites, tumour
XX CC cells and glycolipids. As such, these DNA oligos can be used in gene
XX CC therapy for inducing B-cell activation, treating, preventing or
XX CC ameliorating an immune system disorder or a tumoural disease including
XX CC chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell
XX CC carcinoma. This oligonucleotide sequence is an immunostimulatory non-CpG
XX CC variant DNA oligo, used in an exemplification of the invention.

XX PT New foam protein from cereals useful for improving foam formation,
XX PT stability and half-life in foaming products such as beverages and
XX PT especially beer.
XX PS Example 6; Page 22; 82pp; English.
XX PT
XX CC The present sequence represents a primer used to reverse transcribe mRNA
XX CC encoding the barley 17 kDa foam protein. The protein has foam enhancing
XX CC properties, and belongs to the prolamin storage protein family. It is
XX CC found in the endosperm tissue of mature cereal grain, and is synthesised
XX CC during grain development. The 17 kDa foam protein can be added to
XX CC products, e.g. foaming beverages such as beer, to enhance the foaming
XX CC quality of the product. The protein can be used to produce improved
XX CC brewed products. The proteins and polynucleotides are especially useful
XX CC for improving the formation, stability and half-life of the foam head on
XX CC beer. The antibodies are useful to detect, measure and purify the
XX CC proteins in samples such as transgenic cells/plants and foaming products

XX PT New adipocyte Insulin designated as adpInsl which comprises Insulin A and
XX PT B chains, useful for treating diabetes, particularly type 2 diabetes.
XX PS Disclosure; Page 11; 32pp; English.
XX CC The present invention relates to an adipocyte Insulin adpInsl with
XX CC Insulin A and B chains. Also included are methods of treating diabetes
XX CC using this insulin. The insulin and methods are useful in treating
XX CC diabetes, particularly type 2 diabetes. The present sequence is a PCR
XX CC primer used to isolate the carp adipocyte insulin gene

XX New human polypeptide FD 17 for diagnosing and treating malignant tumor, hemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and inflammations.
XX Example 2; Page 11; 36pp; Chinese.
XX The present invention describes the human FD 17 protein (I). (I) has cytostatic, virucidal, immunomodulatory, antiinflammatory and haemostatic activities. The polynucleotide encoding (I) can be used in gene therapy. (I) and the polynucleotide encoding it are applicable in the diagnosis and treatment of malignant tumour, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. The present sequence represents a PCR primer for human FD 17, which is used in an example from the present invention

XX Polypeptide-laminin B210.67, useful for treating diseases such as embryo development teratogenesis.
XX Example 2; Page 18 (disclosure); 33pp; Chinese.
XX The present invention relates to the isolation of polypeptide-laminin B210.67, and the polynucleotide encoding it. Also described is the process for preparing the protein by DNA recombination. The polypeptide is useful for treating diseases such as embryo development teratogenesis. The present sequence for reverse transcriptase (RT)-PCR primer #1 is used with RT-PCR primer #2 (ABK12410) for isolating cDNA encoding polypeptide-laminin B210.67

XX Clusterin and gp38K-related peptide capable of altering cell migration
PT useful for treating atherosclerosis, cancer and stenosis following
PT vascular trauma or disease.
XX
PS Disclosure; Page 12; 43pp; English.
XX
CC The present sequence is a PCR primer for the murine clusterin gene.
CC Clusterin (also known as complement cytolyis inhibitor, sulfated
CC glycoprotein-2, testosterone repressed prostate message-2, SP-40, 40 and
CC ApoJ) is essential for the migration of vascular smooth muscle cells
CC (VSMC). The gene and protein can, therefore, be used to promote wound
CC healing, angiogenesis and vasculogenesis, in the treatment of stenosis
CC following vascular trauma or disease and to treat atherosclerosis, and
CC antisense sequences can be used to treat cancer, as angiogenesis is vital
CC for tumour survival

XX

Identifying a candidate polymorphic repeat within a coding sequence, for understanding or treating genetic disease, comprises detecting tandem repeats in a target coding sequence and scoring the repeats for polymorphic probability.

Example; Col 495; 588pp; English.

The invention discloses a method for identifying a candidate polymorphic repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis, myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTs

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.

Example; Page 5; 8pp; German.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture agents are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, metal, resin, gel, crystalline material and/or membrane, having semi-conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It allows imaging of the complete pattern of all nucleic acid in a cell, and can detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent capture probes used in the method of the invention.

PT Sorting single-stranded nucleic acid, useful for analyzing expression
PT patterns and screening active agents, uses capture agent with variable
PT and constant regions.

PS Example; Page 5; 8pp; German.

CC This invention describes a novel method for sorting single-stranded
CC nucleic acids by isolation and hybridisation of nucleic acid pools, then
CC reading out, where the nucleic acids are selectively bound using capture
CC agents that are (a) immobilised on the surface of a solid matrix and (b)
CC comprise variable and non-variable regions. The capture oligonucleotides

CC have a 5'-invariable anchor region, the complement of which is present at
CC least once in each nucleic acid and a 3'-variable, discriminatory region
CC that comprises all possible combinations of up to 10 nucleotides to allow
CC binding of particular sorts of single stranded nucleic acids. The capture
CC agents are particularly locked nucleic acids (LNA) and the anchor region
CC comprises a sequence of 10-50, particularly 15-25, T residues. The
CC capture oligonucleotides are biotinylated and immobilised on a surface by
CC interaction with streptavidin. The matrix is of plastic, ceramic, glass,
CC metal, resin, gel, crystalline material and/or membrane, having semi-
CC conducting properties and especially in the form of a chip. Its surface
CC is particularly a layer of (bio)molecular filaments and binding of single
CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular,
CC physical, stimulated by an electrical field or through a molecular sieve.
CC The method is used (i) for analysis of patterns, especially in mucosal,
CC hair root, blood, nerve or germ cells and (ii) for determining the
CC activity of pharmaceuticals and/or nutritional compounds, e.g. food
CC additives or supplements, especially minerals, trace elements, organic
CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and
CC mixtures. The method provides rapid, inexpensive and reproducible
CC representation of differences in pools of nucleic acids from cells. It
CC allows imaging of the complete pattern of all nucleic acid in a cell, and
CC can detect very small differences in the nucleic acid pool. Since the
CC method is based on comparison of nucleic acid pools, not individual
CC genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent
CC capture probes used in the method of the invention.

PT Sorting single-stranded nucleic acid, useful for analyzing expression
PT patterns and screening active agents, uses capture agent with variable
PT and constant regions.
XX
PS Example; Page 6; 8pp; German.
XX
CC This invention describes a novel method for sorting single-stranded
CC nucleic acids by isolation and hybridisation of nucleic acid pools, then
CC reading out, where the nucleic acids are selectively bound using capture
CC agents that are (a) immobilised on the surface of a solid matrix and (b)
CC comprise variable and non-variable regions. The capture oligonucleotides
CC have a 5'-invariable anchor region, the complement of which is present at
CC least once in each nucleic acid and a 3'-variable, discriminatory region
CC that comprises all possible combinations of up to 10 nucleotides to allow
CC binding of particular sorts of single stranded nucleic acids. The capture
CC agents are particularly locked nucleic acids (LNA) and the anchor region
CC comprises a sequence of 10-50, particularly 15-25, T residues. The
CC capture oligonucleotides are biotinylated and immobilised on a surface by
CC interaction with streptavidin. The matrix is of plastic, ceramic, glass,
CC metal, resin, gel, crystalline material and/or membrane, having semi-
CC conducting properties and especially in the form of a chip. Its surface
CC is particularly a layer of (bio)molecular filaments and binding of single
CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular,
CC physical, stimulated by an electrical field or through a molecular sieve.
CC The method is used (i) for analysis of patterns, especially in mucosal,
CC hair root, blood, nerve or germ cells and (ii) for determining the
CC activity of pharmaceuticals and/or nutritional compounds, e.g. food
CC additives or supplements, especially minerals, trace elements, organic
CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and
CC mixtures. The method provides rapid, inexpensive and reproducible
CC representation of differences in pools of nucleic acids from cells. It
CC allows imaging of the complete pattern of all nucleic acid in a cell, and
CC can detect very small differences in the nucleic acid pool. Since the
CC method is based on comparison of nucleic acid pools, not individual
CC genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent
CC capture probes used in the method of the invention.

PT Novel maize cytochrome P450 monooxygenase polypeptides and
PT polynucleotides, used to confer triasulfuron herbicide resistance to
PT plants.
XX
PS Example 1c; Page 52; 77pp; English.
XX
CC The present sequence is the oligo (dT) non-degenerate RT-PCR primer, 3'PC
CC -1, complementary to the poly(A) tract of the CYP71C3v2 mRNA. It is used
CC to extract and amplify mRNA isolated from naphthalic anhydride-treated
CC maize seedlings. The CYP71C3v2 gene is mapped to a single locus on the
CC short arm of maize chromosome 4 (4p). CYP71C3v2 reductively cleaves
CC molecular dioxygen to produce functionalised organic substrates. It has
CC herbicidal activity. CYP71C3v2 polynucleotides are used to produce
CC transgenic organisms, such as yeast, plants and bacteria that are
CC resistant to herbicides, such as triasulfurons. Undesired vegetation,
CC e.g. weed, pigweed, velvet leaf, labs quarters, Chenopodium album and
CC quack grass, can easily be controlled when such transgenic plants are
CC grown. Transformed organisms can also be used to identify compounds with
CC herbicidal activity

XX
PT Use of a prostate cancer associated gene and biallelic markers derived
PT from it.
XX
PS Example 6; Page 42; 385pp; English.
XX
CC The invention relates to a mammalian PG1 gene and protein, and a set of
CC PG1 biallelic markers. The PG1 polynucleotide and biallelic markers are
CC used in a hybridisation assay, a sequencing assay, or in an allele-
CC specific amplification assay for determining the identity of a nucleotide
CC at a PG1-related biallelic marker. The methods can be used to detect and
CC to assess the risk of developing cancer or prostate cancer. Early-stage
CC diagnosis of prostate cancer relies on prostate specific antigen (PSA)
CC dosage. However, the effectiveness of this is limited due to its
CC inability to discriminate between malignant and non-malignant affections
CC of the organ. A need exists for both a reliable diagnostic procedure
CC which would enable early-stage diagnosis, and for preventative and
CC curative treatments of the disease. The PG1 gene can be used for
CC detection of prostate cancer, and the risk of developing it in the
CC future, and can also be used to determine therapies for the disease

XX Novel nucleic acid comprising a locked nucleic acid unit having a
XX modified base that comprises an optionally substituted carbocyclic aryl
XX moiety, or modified nucleobase or nucleosidic base other than
XX oxazole/imidazole.
XX Example 24a; Page 90; 119pp; English.
XX The present sequence is that of pyrene-anchored locked nucleic acid (LNA)
XX oligo(dT) primer ON12, which was used in first-strand cDNA synthesis from
XX eukaryotic mRNA. It includes compound '17d' at its 3' end, which is based
XX on an LNA-type 2'-O,4'-C-methylene- beta-D-ribofuranosyl moiety. It is
XX one of a set of such primers (see also ACC48483-85) that were used in an
XX example from the invention to demonstrate improved reverse transcription
XX of mRNA using pyrene-LNA anchored oligo(T) primers. The following results
XX were observed: efficient priming on mRNAs with short poly(A) tails;
XX efficient anchoring of the oligo(T) primer by pyrene-LNA and LNA-C/G/T
XX units resulting in an improved T20-VN anchor primer and thus avoiding
XX reverse transcription of long poly(A) tracts; and improved reverse
XX transcription of eukaryotic poly(A)+RNA directly from total RNA extracts
XX due to increased specificity. The invention relates to modified LNA units
XX that comprise unique base groups. Desirable nucleobase and nucleosidic
XX base substitutions can mediate universal hybridisation when incorporated
XX into nucleic acid strands. The novel LNA compounds can be used e.g. as
XX PCR primers, in sequencing, the synthesis of antisense oligonucleotides,
XX and in diagnostics

PT Determining the relative copy number of a group of target nucleic acid
PT molecules present in a sample by performing a first or second PCR in a
PT PCR mixture and quantifying the number of copies of the second target
PT nucleic acid product.
XX
PS Example 1; Page 68; 118pp; English.
XX
CC The present invention describes a multiplex real-time quantitative PCR
CC method for determining the relative copy number of a group of target
CC nucleic acid molecules present in a sample. The method comprises: (1)
CC performing a first PCR in a PCR mixture; (2) performing a second PCR in a
CC PCR mixture; and (3) quantifying the number of copies of the second
CC target nucleic acid product present in the sample containing the target
CC nucleic acid molecule. Also described: (1) quantifying the copy number of
CC a group of target nucleic acids in a sample; and (2) determining whether
CC a subject is at risk of acquiring Alzheimer's disease. The method is
CC useful for determining the relative copy number of a group of target
CC nucleic acid molecules present in a sample for determining whether a
CC subject is at risk of acquiring Alzheimer's disease. ACC99620 to ACC99730

PS Disclosure; Page 39; 338pp; English.
XX
CC The present invention relates to a method for stimulating an immune
CC response. The method comprises administering an immunostimulatory nucleic
CC acid to a non-rodent subject in sufficient quantity to stimulate an
CC immune response. The present sequence is one such immunostimulatory
CC nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
CC (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects
CC against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
CC and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,
CC haemophilus, campylobacter, clostridium, Escherichia coli and/or
CC staphylococcus), fungal antigens and/or parasitic antigens. The method is
CC also useful for preventing cancer, asthma, infectious disease, allergy or
CC immune deficiency. The present sequence can also be used to redirect a
CC Th2 to a Th1 immune response and to activate immune cells. Note: the
CC present sequence may have a phosphorothioate backbone

CC contain a non-palindromic sequence motif. Specifically, it refers to DNA
CC oligonucleotides (without a CpG motif), which can stimulate an immune
CC response in animals of the order of primate, including humans. The immune
CC response is characterised by the proliferation, differentiation, cytokine
CC and antibody production in B-cells, as well as cell differentiation and
CC cytokine production in plasmacytoid dendritic cells. The present
CC invention describes immunomodulator compositions that also comprise an
CC antigen selected from, for example, viruses, bacteria, parasites, tumour
CC cells and glycolipids. As such, these DNA oligos can be used in gene
CC therapy for inducing B-cell activation, treating, preventing or
CC ameliorating an immune system disorder or a tumoural disease including
CC chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell
CC carcinoma. This oligonucleotide sequence is an immunostimulatory non-CpG
CC variant DNA oligo, used in an exemplification of the invention.

PT   Typing genes that contain polymorphic microsatellite loci, useful for
PT   identifying predisposition to disease, by amplification and determining
PT   length of amplicons.
XX
PS   Example 3; Page 29; 64pp; German.
XX
CC   The invention describes a method of typing (M1) a gene (I) that has one
CC   or more polymorphic microsatellite loci (PML). The method comprises: PCR
CC   amplification of at least one DNA region of (I) that includes PML, using
CC   as template a DNA sample containing at least one segment of (I); and
CC   determining the length of the resulting amplicon(s). Also described are:
CC   a method of determining (M2) microsatellite markers (MM) for
CC   predisposition to a disease, associated with a gene that includes one or
CC   more PML; and prediagnosis (M3) of diseases associated with gene that
CC   include PML. The method is used to identify microsatellite markers, in a
CC   disease-related gene, that are associated with a predisposition to
CC   diseases and for prediagnosis of such diseases, especially prion diseases
CC   but also cystic fibrosis, malignant hyperthermia syndrome in pigs and
CC   metabolic diseases; also to type genes that encode milk proteins,
CC   hormones or transcription factors. The method is simpler, quicker and
CC   particularly less expensive than known methods based on sequencing. This
CC   sequence represents a primer used to genotype a region of the cow prion
CC   protein (PrP) comprising a polymorphic microsatellite locus.

 PT New aminoxy-modified oligonucleotides - which can show improved binding
 PT to complementary strands and improved resistance to nuclease.
 XX
 PS Disclosure; Page 84; 131pp; English.
 XX
 CC The invention relates to aminoxy-modified(oligo)nucleotides or
 CC nucleosides which are useful as therapeutics, diagnostics, and research
 CC reagents. They may be used, e.g., for modulation of the ras gene and may
 CC be able to modulate the process of transformation from normal to
 CC malignant cell growth. They may be prepared using known methods.

CC Inclusion of the aminoxy moieties can improve binding of
 CC oligonucleotides to complementary strands. The moieties can also provide
 CC conjugation sites useful for conjugation of useful ligands (e.g. reporter
 CC groups and groups for modifying uptake, distribution or other
 CC pharmacodynamic properties) to oligonucleotides. The present sequence
 CC represents an example of an aminoxy-modified oligonucleotide disclosed
 CC in the specification

PT	New microelectronic device designed to carry out and control multi-step																							
PT	and multiplex molecular biological reactions in microscopic format.																							
XX																								
PS	Example 1; Page 90; 179pp; English.																							
XX																								
CC	The specification describes a self-addressable, self-assembling																							
CC	microelectronic device which is designed to actively carry out and																							
CC	control multi-step and multiplex molecular biological reactions in																							
CC	microscopic formats. A key aspect of this inventions is played by the ion																							
CC	-permeable permeation layer which overlies the electrode. This permeation																							
CC	layer allows attachment of nucleic acids to permit immobilization but																							
CC	also separates the attached oligonucleotides and hybridized target DNA																							
CC	sequences from the highly reactive electrochemical environment generated																							
CC	immediately at the electrode surface. The microelectronic device is																							
CC	designed and fabricated to actively carry out and control reactions such																							
CC	as nucleic acid hybridizations, antibody/antigen reactions, sample																							
CC	preparation, diagnostics and biopolymer synthesis. The device can																							
CC	electronically control the transport and attachment of specific binding																							
CC	entities, such as nucleic acids and polypeptides, to specific micro-																							
CC	locations. The device can subsequently control the transport and reaction																							
CC	of analytes or reactants at the addressed specific micro-locations. The																							
CC	device is able to concentrate analytes and reactants, remove non-																							
CC	specifically bound molecules, provide stringency control for DNA																							
CC	hybridization reactions and improve the detection of analytes. The																							
CC	present sequence represents a probe used to exemplify the invention

PT from it.
PT
XX
PS Claim 4; Page 374; 385pp; English.
XX
CC The invention relates to a mammalian PG1 gene and protein, and a set of
CC PG1 biallelic markers. The PG1 polynucleotide and biallelic markers are
CC used in a hybridisation assay, a sequencing assay, or in an allele-
CC specific amplification assay for determining the identity of a nucleotide
CC at a PG1-related biallelic marker. The methods can be used to detect and
CC to assess the risk of developing cancer or prostate cancer. Early-stage
CC diagnosis of prostate cancer relies on prostate specific antigen (PSA)
CC dosage. However, the effectiveness of this is limited due to its
CC inability to discriminate between malignant and non-malignant affections
CC of the organ. A need exists for both a reliable diagnostic procedure
CC which would enable early-stage diagnosis, and for preventative and
CC curative treatments of the disease. The PG1 gene can be used for
CC detection of prostate cancer, and the risk of developing it in the
CC future, and can also be used to determine therapies for the disease

The present sequence represents an uniform phosphodiester
oligonucleotide. The specification describes oligomeric compounds
containing 2'-O-modified ribosyl nucleosides. The 2'-O-modified
nucleosides include ring structures that position the sugar moiety of the
nucleosides preferentially in 3' endo geometries. The modified oligomeric
compounds have increased binding affinity and increased nuclease
resistance. The oligomeric compounds can be used in diagnostic,
therapeutic and research reagents

 PT Aminoxy-modified nucleosides and oligonucleotides useful in diagnostic,
 PT therapeutic and research reagents and for modulating the expression of
 PT protein in organisms.
 XX
 PS Example 99; Page 120; 195pp; English.

XX The invention relates to aminoxy-modified nucleosides and
CC oligonucleotides and to oligonucleotides that elicit RNase H for cleavage
CC in a complementary nucleic acid strand. It also relates to
CC oligonucleotides wherein at least some of the nucleotides are
CC functionalised to be nuclease resistant, at least some of the nucleotides
CC include a substituent that potentiates hybridisation of the
CC oligonucleotide to a complementary strand, and at least some of the
CC nucleotides include a 2'-deoxy-erythro-pentofuranosyl sugar moiety. The
CC inclusion of one or more aminoxy moieties in such oligonucleotides
CC provides for improved binding of such oligonucleotides to a complementary
CC strand. The oligonucleotides of the invention aare used as diagnostic,
CC therapeutic or research reagents, and can be used to modulate gene
CC expression in organisms. The oligonucleotides containing the modified
CC nucleosides have increased nuclease resistance and increased binding
CC affinity to a complementary strand. The present sequence represents an
CC oligonucleotide containing nucleotides substituted with a 2'-O-{2- [N-(2-
CC aminoethyl-N-(methyl)aminoxyethyl} group

Novel method for the production of oligomers with reduced exocyclic
adducts comprises treatment with deprotecting and cleaving reagents.
XX
Example 2; Page 17; 33pp; English.
XX
This invention describes a novel synthetic method (M) comprising: (a)
providing a sample comprising a number of oligomers of formula (I); (b)
contacting the sample with a deprotecting agent to remove Rt groups from
the oligomers; and (c) reacting the oligomer with a cleaving reagent. The
method is used to produce oligomeric compounds for use in antisense and
oligonucleotide therapies. The method enables the synthesis of oligomers
with a reduction in the number acrylonitrile groups attached.

Detaching nucleic acid molecule comprising unconventional nucleotide
incorporated at predetermined site from a solid support involves cleaving
the nucleic acid molecule at the site of unconventional nucleotide.
XX
Example 3; Page 34; 47pp; English.
XX
The present invention is concerned with the cleavage of nucleic acids
from solid supports. This is carried out by adding a non-conventional
nucleotide into the nucleic acid attached to the support, so that it is
recognised and cleaved by a specific DNA glycosylase and the sequence is
released. This is useful in many molecular biological procedures such as
sequencing, in vitro amplifications, cDNA and template preparation, DNA-
based assays, mutagenesis procedures, nucleic acid purification and
affinity chromatography. The present sequence is an oligonucleotide used
in assays to demonstrate the methods of the invention

PT New 2'-O-acetamido modified nucleosides (I) used to produce
PT oligonucleotides which have enhanced nuclease resistance and superior
PT hybridization properties than prior art.
XX
PS Example 12; Col 28; 29pp; English.
XX
CC The present sequence is a modified oligonucleotide. 2'-O-acetamido-
CC modified nucleosides were used to produce oligonucleotides which have
CC enhanced nuclease resistance and superior hybridisation properties than
CC prior art. The oligomeric compounds are useful for identification or
CC quantification of ribonucleic acid and deoxyribonucleic acid or for
CC modulating the activity of an ribonucleic acid or deoxyribonucleic acid
CC molecule. They have a modified nucleoside monomer and are specifically
CC hybridisable with a preselected nucleotide sequence of a single-stranded
CC or double-stranded target deoxyribonucleic acid or ribonucleic acid
CC molecule. The oligomers are further useful in a ras-luciferase fusion
CC system using ras-luciferase transactivation. They are useful in abnormal
CC cell proliferation and tumour formation and modulation of expression of
CC protein kinase C and cell adhesion molecules such as ICAM. They are
CC useful in the modulation of proteins related to multidrug resistance and
CC viral genomic nucleic acids such as HOV, herpes viruses, Epstein-Barr
CC virus, cytomegalovirus, papillomavirus, hepatitis C virus and influenza
CC virus

PT Determining targets by interaction with probe array, useful e.g. for
PT diagnosis, based on detecting formation of precipitate at specific probe
PT sites.
XX
PS Example 5; Page 47; 92pp; German.
XX
CC The present invention relates to a method for the qualitative and
CC quantitative detection of targets in a sample by molecular interaction
CC between the target and probes in an array. The method can be used to
CC detect interactions between nucleic acids, antigens and antibodies or
CC receptor and ligands, particularly in applications such as medical
CC diagnosis, forensic science, bacterial screening, tissue typing for
CC transplantation, monitoring gene expression, and genotyping. The present
CC sequence is a modifying oligonucleotide used in the exemplification of
CC the invention

XX
XX Alkylation of alcohols, amines, or thiols, useful for preparing
PT nucleosides that are precursors for preparation of oligomeric compounds
PT beneficial as therapeutics, involves use of cyclic sulfate intermediates.
XX
XX Example 15; Col 35; 45pp; English.
XX
XX The present sequence is that of a chimeric oligonucleotide having some 2'
CC -methyl thioethyl modifications. This was compared with oligonucleotides
CC with methoxyethoxy (see ABA91950) and dimethylaminopropyl (see ABA91951)
CC modifications for resistance to snake venom phosphodiesterase. The assay
CC revealed the nuclease resistance of the modified oligomers. The invention
CC provides methods for the alkylation of alcohols, amines, thiols and their
CC derivatives by cyclic sulfate intermediates. In particular, methods for
CC the alkylation of the 2', 3' or 5'-hydroxy position of nucleosides and
CC their analogues with cyclic sulfates to form the 2', 3' or 5'-O-alkyl
CC sulfate modified compounds are disclosed. Displacement of the 2', 3' or
CC 5'-O-sulfate with a nucleophile provides 2', 3' or 5'-O-modified
CC nucleosides and their analogues. The methods are especially useful for
CC the preparation of 2'-O-alkyl nucleotides, nucleosides and nucleoside
CC surrogates that are precursors for the preparation of oligomeric
CC compounds useful as therapeutics, diagnostics and research reagents

XX
XX New oligonucleotide comprising at least one 2',5'-internucleotide linkage
PT useful for treating organisms having disease caused by undesired
PT production of protein e.g. bacteria, yeast, protozoa and algae.
XX
PS Example 54; SEQ ID NO 6; 30pp; English.
XX
CC The invention describes an oligonucleotide comprising several nucleotides
CC covalently linked together by internucleotide linkages. At least one of
CC the nucleotides is linked to an adjacent nucleotide by 2',5'-
CC internucleotide linkage and bears a 3'-substituent. The oligonucleotides
CC are useful: as antisense oligonucleotides; in pharmaceutical compositions
CC ; for treating organisms having disease caused by undesired production of
CC protein e.g. organism that utilises RNA-DNA transcription or RNA-protein
CC translation, bacteria, yeast, protozoa, algae and warm-blooded animals;
CC for developing diagnostic and therapeutic agents. The modified
CC oligonucleotide exhibits improved properties of nuclease resistance and
CC binding affinity. The oligonucleotides are easy to synthesise and exhibit
CC good properties of nuclease resistance and hybridisation to target
CC nucleic acids. The oligonucleotide is potent antisense agent with longer
CC duration of action. This sequence represents an oligonucleotide of the
XX invention.

PS Claim 4; SEQ ID NO 67; 63pp; English.
XX
CC The present sequence is the sense strand of a short interfering RNA
CC (siRNA) targeted to a specific portion ADL70521 of human clusterin CDNA.
CC The antisense strand is also provided ADL70523. The siRNA can be used to
CC interfere with the expression of clusterin. Clusterin, also known as
CC testosterone-repressed prostate message-2 (TRPM-2) or sulfated
CC glycoprotein-2 (SGP-2), is expressed in increased amounts by prostate
CC tumour cells following androgen withdrawal, and has also been shown to be
CC critical for neuritic toxicity in mouse models of Alzheimer's disease.
CC siRNAs of the invention can be used alone or in combination with other

CC chemotherapy or apoptosis inducing treatments for the treatment of
CC prostate cancer, sarcomas such as osteosarcoma, renal cell carcinoma,
CC breast cancer, bladder cancer, lung cancer, colon cancer, ovarian cancer,
CC anaplastic large cell lymphoma and melanoma, and also for the treatment
CC of Alzheimer's disease. In an example from the invention, the present
CC siRNA was used to examine the effects of clusterin gene silencing in PC-3
CC prostate cancer cells. A reduction in clusterin transcript was observed.

PT Treating melanoma in a mammalian subject comprises administering to the
PT subject a therapeutic agent effective to reduce the effective amount of
PT clusterin in the melanoma cells.
XX
PS Claim 20; SEQ ID NO 42; 32pp; English.
XX
CC The present sequence is that of a short interfering RNA (siRNA) molecule
CC targeted to human clusterin ADL70403. The invention relates to the
CC treatment of melanoma through reduction in the effective amount of
CC clusterin. The therapeutic agent may be an antisense oligonucleotide
CC ADL70404-ADL70421 or short interfering RNA (siRNA) ADL70422-ADL70445
CC targeted to clusterin. The siRNAs molecules direct cleavage of clusterin

CC mRNA. A method for regulating expression of bcl-xL in a subject or cell
CC line comprises administering an agent effective to modulate the amount of
CC clusterin expression. In clusterin-expressing cells, expression of bcl-xL
CC is down-regulated when the effective amount of clusterin is reduced. Such
CC inhibition is significant because bcl-xL is known to act as an inhibitor
CC of apoptosis.

Carbon nanotube attached with one or more nucleic acid molecules, useful as biosensor for screening presence of bacterial or viral nucleic acid in clinical samples.

Example 6; Page 91; 147pp; English.

The present invention describes a nanotube (I) attached with one or more nucleic acid molecule(s). Also described: (1) chemically modifying (M1) a nanotube; (2) physically modifying (M2) a nanotube; (3) linking (M3) nanotubes; (4) a several linked nanotubes (II) produced by (M3); (5) directing (M4) nanotubes to specific targets; (6) a nucleic acid sensor (III) comprising (I), where the base sequence of the attached nucleic acid molecule is substantially complementary to all or a portion of the base sequence of the nucleic acid molecules being detected; (7) a DNA array consisting of an array of groups of one or more nanotubes, each group having one or more nucleic acid molecules of the same base sequence attached to each nanotubes in the group, and where the base sequence of the nucleic acid molecules, attached to the nanotubes in one group differs from those in other groups so that a number of different target DNA molecules may be detected; (8) an actuator comprising (I) and a membrane support to which the DNA-modified nanotubes are attached; and (9) a conductor (IV) comprising (I). (I) is useful in coating one or more nanotubes with nanoparticles, which involves exposing (I) to nanoparticles comprising several attached complementary nucleic acid molecules, where the nanoparticles hybridize to the nucleic acid molecules on the surface of the nanotube(s) as well as self-annealing to

CC other nanoparticles, forming one or more coated nanotubes. (I) can be
CC used as a biosensor for detecting complementary nucleic acid strands,
CC useful in clinical application for screening presence of bacterial or
CC viral nucleic acid, in pharmaceutical applications, agricultural
CC applications, food control, hygiene and environmental monitoring and
CC forensic applications. (II) is useful as a nano-scale conductor or
CC semiconductor, more specifically as a component in nano-electronic
CC applications, as a replacement for damaged nerves in prostatic
CC applications, or as the bio-electronic interface in bio-electronic
CC devices. (II) can also be used as a transistor or gated device. The
CC present sequence represents an oligonucleotide which is used in an
CC example from the present invention.

DR Interference RNA agent useful for treating dyslipidemias, coronary artery
XX disease, diabetes, cancer or neurological disease, comprises sense
PT sequence and antisense sequence which has specific modifications.
PT Example 5; SEQ ID NO 6759; 378pp; English.
XX The invention describes a RNA interference (irna) agent (I) comprising a
CC sense sequence and an antisense sequence, where the sense sequences have
CC one or more asymmetrical 2'-O alkyl modifications, the antisense
CC sequences have one or more asymmetrical phosphorothioate modifications
CC and the antisense sequence targets a human gene sequence. Also described
CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100
CC levels or glucose-6-phosphatase levels in a subject; producing (I);
CC stabilising (I), involves selecting a sequence with activity and
CC introducing one or more asymmetrical modification in the sequence, where
CC the modification decreases nuclease sensitivity while not decreasing its
CC activity; a kit comprising (I) and instruction for its use; and a device
CC that can be dispense or administer a composition comprising (I). (I) is
CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)
CC The subject is suffering from a disorder characterised by elevated or
CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted
CC levels of cholesterol, and/or dysregulation of lipid metabolism. The
CC disorder is chosen from the HDL/LDL cholesterol imbalance,
CC dyslipidaemias, hypercholesterolaemia, statin-resistant
CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart
CC disease (CHD) and atherosclerosis. (I) is administered to a subject to
CC inhibit hepatic glucose production or for treating glucose-metabolism-
CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
CC treating the diseases as mentioned above, cancer (e.g. breast, colon or
CC lung cancer), neurological disease (e.g., Huntington disease or
CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
CC represents a hepatitis C virus (HCV) antisense oligonucleotide that can
CC be used to control HCV gene expression.

PT Interference RNA agent useful for treating dyslipidemias, coronary artery
PT disease, diabetes, cancer or neurological disease, comprises sense
PT sequence and antisense sequence which has specific modifications.
PS Example 5; SEQ ID NO 6755; 378pp; English.
XX
CC The invention describes a RNA interference (iRNA) agent (I) comprising a
CC sense sequence and an antisense sequence, where the sense sequences have
CC one or more asymmetrical 2'-O alkyl modifications, the antisense
CC sequences have one or more asymmetrical phosphorothioate modifications
CC and the antisense sequence targets a human gene sequence. Also described
CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100
CC levels or glucose-6-phosphatase levels in a subject; producing (I);
CC stabilising (I), involves selecting a sequence with activity and
CC introducing one or more asymmetrical modification in the sequence, where
CC the modification decreases nuclease sensitivity while not decreasing its
CC activity; a kit comprising (I) and instruction for its use; and a device
CC that can be dispense or administer a composition comprising (I). (I) is
CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)
CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.
CC The subject is suffering from a disorder characterised by elevated or
CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted
CC levels of cholesterol, and/or dysregulation of lipid metabolism. The
CC disorder is chosen from the HDL/LDL cholesterol imbalance,

CC dyslipidaemias, hypercholesterolaemia, statin-resistant
CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart
CC disease (CHD) and atherosclerosis. (I) is administered to a subject to
CC inhibit hepatic glucose production or for treating glucose-metabolism-
CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
CC treating the diseases as mentioned above, cancer (e.g. breast, colon or
CC lung cancer), neurological disease (e.g., Huntington disease or
CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
CC represents a hepatitis C virus (HCV) antisense oligonucleotide that can
CC be used to control HCV gene expression.

XX New stem cell factor polypeptide(s) - for stimulating the growth of
PT primitive progenitor cells, esp. for treating disorders involving blood
PT cells.
XX Example 3; Fig 12C; 127pp; English.
PS AAT04915-T04922 are oligonucleotide primers and probes used for the
XX amplification and sequencing of mammalian stem cell factor (SCF). Non-
CC naturally occurring SCF and C-terminally truncated polypeptides, having
CC amino acid sequences sufficiently duplicative of naturally occurring SCF,
CC stimulate growth of primitive progenitors such as haematopoietic
CC progenitor cells, neural stem cells and primordial germ stem cells. The
CC peptides can be used in a composition for treating leucopenia, anaemia or
CC thrombocytopenia, for enhancing engraftment of bone marrow during
CC transplantation or for bone marrow recovery after chemotherapy or
CC radiation-induced bone marrow aplasia or myelosuppression. They can also
CC be used for treating neoplasia, nerve damage, infertility, intestinal
CC damage or myeloproliferative disorders. Antibodies may be raised against
CC the peptides for use in detection or neutralisation of SCF in serum. SCF
CC may be useful for the treatment of AIDS and severe combined
CC immunodeficiency (SCID) states alone or in combination with other factors
CC such as IL-7. (Updated on 25-MAR-2003 to correct PF field.)

PT Production of hematopoietic cells suitable for administration to a
PT subject using progenitor cells and expanding the cells using stem cell
PT factor.
XX
PS Example 3; Fig 12C; 123pp; English.
XX
CC A method has been developed of making haematopoietic cells suitable for
CC administration to a subject. The method comprises: (a) obtaining
CC haematopoietic progenitor cells from a donor; and (b) expanding the cells
CC by adding to the cells a haematopoietically effective dose of a
CC polypeptide product having at least part of the primary structural
CC confirmation and one or more of the biological properties of naturally
CC occurring stem cell factor (SCF). The method is useful for stimulating
CC primitive progenitor cells including early haematopoietic progenitor
CC cells which are capable of maturing to erythroid, megakaryocyte,
CC granulocyte, lymphocyte and macrophage cells. SCF results in absolute
CC increases in haematopoietic cells of both myeloid and lymphoid lineages.
CC SCF is useful for treating haematopoietic disorders. The method is useful
CC for expanding early haematopoietic progenitors in syngeneic, allogeneic
CC or autologous bone marrow transplant. SCF is useful for enhancing the
CC efficiency of gene therapy based on transfecting haematopoietic stem
CC cells. SCF is also useful for combating the myelosuppressive effects of
CC anti-HIV drugs such as AZT and for enhancing haematopoietic recovery
CC after acute blood loss and as a boost to the immune system for fighting
CC neoplasia (cancer). The present sequence represents a universal
CC oligonucleotide which is used in an example from the present invention

PT Enhancing efficiency of transfer of polynucleotide into a target
PT mammalian cell in vitro, involves exposing cell that expresses a stem
PT cell factor receptor to stem cell factor, and introducing polynucleotide
PT into cell in vitro.
XX
PS Example 3; Fig 12C; 210pp; English.
XX
CC The present invention describes a method for enhancing (E) the efficiency
CC of transfer of a polynucleotide (I) into a target mammalian cell (II) in
CC vitro, comprising exposing (II) that expresses a stem cell factor (SCF)
CC receptor to a biologically active SCF, its analogue or fragment, which
CC induces cell proliferation, and introducing (I) to (II) in vitro.
CC Exposure of SCF to (II) results in increased uptake of (I) into the cell.
CC The method is useful for enhancing the efficiency of the transfer of a
CC polynucleotide into a target mammalian cell in vitro. The method is
CC useful in gene therapy techniques. AAH41301 to AAH41364 and AAB98351 to

PS Example 3; Fig 12C; 209pp; English.

XX

CC The present invention provides the protein and coding sequences of

CC mammalian stem cell factors (SCFs). These are capable of stimulating the

CC growth of early haematopoietic progenitor cells, neural stem cells and

CC primordial germ stem cells. The sequences are useful in the treatment of

CC leukaemias, haematopoietic disorders, aplastic anaemia, paroxysmal

CC nocturnal haemoglobinuria, malaria, pigmentation disorders, neurological

CC and intestinal damage, infertility, AIDS and severe combined

CC immunodeficiency (SCID). The present sequence is primer used to amplify

CC an SCF in the exemplification of the invention

CC The present sequence for universal PCR primer 220-11 is 1 of 19 PCR
CC primers (AAS10435-AAS10453) used to amplify various portions of the human
CC SCF cDNA sequence. The sequence is described in an invention relating to
CC novel stem cell factors, the polynucleotides encoding them and methods
CC for producing the stem cell factors. The methods involve increasing the
CC number of early haematopoietic progenitor cells in human peripheral blood
CC by administering a haematopoietically effective human stem cell factor
CC polypeptide. The methods are useful for the treatment of blood disorders,
CC including myelofibrosis, myelosclerosis, osteopetrosis, metastatic
CC carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease,
CC lymphoma, Gaucher's disease, Niemann-Pick disease, refractory anaemia,
CC malaria, vitamin B12 and folic acid deficiency, hypopigmentation
CC disorders i.e. piebaldism and viral induced disorders, including AIDS

PT Novel non-naturally-occurring stem cell factor polypeptide, useful for
PT treating leucopenia, thrombocytopenia, anemia and for enhancing
PT engraftment of bone marrow during transplantation in a mammal.
XX
PS Example 3; Fig 12C; 217pp; English.
XX
CC The present invention relates to novel non-naturally-occurring stem cell
CC factor (SCF) polypeptides having an amino acid sequence sufficiently
CC duplicative of that of naturally-occurring SCF to allow possession of
CC haematopoietic biological activity of naturally occurring SCF. Sequences
CC of the invention are useful for treating leucopaenia, thrombocytopaenia,
CC anaemia and for enhancing bone marrow recovery in treatment of radiation,
CC engraftment of bone marrow during transplantation in mammals and chemical
CC or chemotherapeutic induced bone marrow aplasia or myelosuppression. They
CC are also useful for treating acquired immune deficiency in a human, nerve
CC damage, neoplasia, infertility, myeloproliferative disorder, intestinal
CC active polymer polypeptide adduct, for enhancing transfection of early
CC haematopoietic progenitor cells with a gene, and transfer of a gene into
CC a mammal. They are useful for treating myelofibrosis, myelosclerosis,
CC osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma,
CC Hodgkin's disease, lymphoma, Gaucher's disease, Niemann-Pick disease,
CC Letterer-Siwe disease, refractory erythroblastic anaemia, Di Guglielmo
CC syndrome, congestive splenomegaly, Kala azar, sarcoidosis, primary
CC splenic pancytopenia, disseminated fungus disease, malaria, military
CC tuberculosis, Fulminating septicaemia, pyridoxine deficiency, vitamin B12
CC and folic acid deficiency, Diamond Blackfan anaemia, hypopigmentation
CC disorders such as piebaldism, AIDS (acquired immune deficiency syndrome)
CC and vitiligo. The present sequence is a PCR primer which is used for
CC amplifying the 5' end of rat SCF cDNA. This sequence is used in the
CC exemplification of the invention

PT   Production of a human stem cell factor (SCF) polypeptide for treating
PT   disorders involving blood cells, such as leukemia, comprises culturing
PT   mammalian cells comprising non-human SCF promoter DNA linked to DNA
PT   encoding the human SCF.
XX
PS   Example 3; Fig 12C; 120pp; English.
XX
CC   The present invention relates to novel stem cell factors (SCFs),
CC   polynucleotide sequences encoding the SCFs, and methods of producing
CC   them. SCFs are involved in the blood-forming (haematopoietic) system in
CC   mammals, particularly humans. The method of the invention is useful for
CC   the production of human SCF. The stem cell factors are useful to treat
CC   disorders involving blood cells e.g. metastatic carcinoma, acute
CC   leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, refractory
CC   erythroblastic anaemia, miliary tuberculosis, disseminated fungus
CC   disease, malaria, and vitiligo. The present sequence representing a
CC   universal oligonucleotide for SCF DNA is used in the examples of the
CC   present invention

PT   New non-natural stem cell factor, useful for treating e.g. leucopenia or
PT   immune deficiency, also related nucleic acid and antibodies.
XX
PS   Disclosure; SEQ ID NO 34; 217pp; English.
XX
CC   The invention relates to stem cell factor (SCF) polypeptides with
CC   haematopoietic activity and the polynucleotides encoding them. The
CC   polypeptides are used for treating infertility, intestinal damage,
CC   myeloproliferative disorders, leucopenia, thrombocytopenia or anaemia,
CC   for improving engraftment of bone marrow transplants, for enhancing bone
CC   marrow recovery after radiotherapy or chemotherapy and in treatment of
CC   immune deficiency, neoplasia, nerve damage, osteoporosis, metastatic
CC   carcinoma, leukaemia and miliary tuberculosis. The SCF polypeptides are
CC   also used to expand haematopoietic progenitor cells for transplantation
CC   and to prepare such cells for transfection with a gene. The SCF
CC   polynucleotides can be used for recombinant expression of the
CC   polypeptides and also as probes for mapping of the SCF gene, for
CC   identifying SCF-related diseases and as a marker for neighbouring genes.
CC   Antibodies raised against the polypeptides are useful in diagnosis and to
CC   remove SCF from blood. This sequence represents SCF related DNA of the
CC   invention.

XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 4421; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or

CC This invention describes a novel composition (a) a first active agent,
CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to

CC prevent any unwanted effects due to it

CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to

CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

PT with Nav1.3, e.g. pain, seizure disorder such as childhood seizure
PT disorder, or ataxia.

PS Claim 4; SEQ ID NO 1981; 417pp; English.

XX The present invention relates to an antisense compound targeted to a
CC nucleic acid molecule encoding Nav1.3, where the antisense compound
CC specifically hybridizes with and inhibits the expression of Nav1.3. The
CC compound and composition are useful for treating a disease or condition
CC associated with Nav1.3, e.g. pain including but not limited to
CC neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain,
CC diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain,
CC pain from burns, migraine headache, cluster headache, mild-to-moderate
CC headache; seizure disorder such as childhood seizure disorder, including
CC but not limited to neonatal or infantile epilepsy; or ataxia. The present
CC sequence represents a chimeric phosphorothioate oligonucleotide with
CC 2'MOE wings and a deoxy gap. Used during the antisense inhibition of
CC human Nav1.3 expression, the oligonucleotides are designed to target
CC different regions of the human Nav1.3 RNA.

PT ischemia.
XX
PS Claim 4; SEQ ID NO 433; 132pp; English.
XX
CC The present sequence represents a chimeric antisense oligonucleotide
CC targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The
CC human mPGES-1 gene is located on chromosome 9, more specifically to
CC 9q34.3. The present invention also describes: (1) antisense compounds,
CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding
CC mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and
CC inhibits its expression; (2) a method of inhibiting the expression of
CC mPGES-1 in cells or tissues; and (3) a method of treating an animal
CC having a disease or condition associated with mPGES-1. mPGES-1 chimeric
CC antisense oligonucleotides and antisense compounds have cytostatic,
CC antidiabetic, immunomodulator, cardiant, neuroprotective,
CC antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic,
CC ophthalmological, immunomodulatory and cardiovascular activities, and can
CC be used as mPGES-1 inhibitors and in gene therapy. The antisense compound
CC can be used for preparing a composition for treating a disease or
CC condition associated with mPGES-1 e.g., inflammation, Alzheimer's
CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
CC ophthalmic, immunological, cardiovascular or neurological disorder.

XX Preparing a human stem cell factor (SCF) polypeptide, useful for treating
PT hematopoietic disorders, e.g., aplastic anemia, comprises growing host
PT cells transformed or transfected with DNA encoding a human SCF.
XX
XX Example 3; SEQ ID NO 34; 210pp; English.
PS
XX
XX The invention relates to preparing a (vertebrate) human stem cell factor
CC (SCF) polypeptide comprising growing host cells transformed or
CC transfected with DNA encoding a human SCF that stimulates growth of
CC haematopoietic progenitor cells under nutrient conditions, the DNA being
CC operatively linked to an expression control sequence, and isolating the
CC polypeptide produced. Also included is a recombinant host cell
CC transformed or transfected with an expression construct comprising a
CC vertebrate SCF polypeptide-encoding DNA operatively linked to a
CC heterologous expression regulatory sequence, permitting the expression of
CC the vertebrate SCF polypeptide in the host cell. Disclosed as new are rat
CC and human nucleic acids encoding SCF, SCF proteins from a number of other
CC mammals and recombinantly expressed SCF protein fragments. The DNA
CC sequences are useful for effecting the large scale synthesis of SCF by a
CC variety of recombinant techniques or for generating new and useful viral

CC and circular plasmid DNA vectors, new and useful transformed and
CC transfected prokaryotic and eukaryotic host cells, and new and useful
CC methods for cultured growth of such host cells capable of expression of
CC SCF and its related products. The DNA sequences are also useful as
CC labelled probes in isolating human genomic DNA encoding SCF, in methods
CC of protein synthesis, in genetic therapy in humans and other mammals, and
CC in developing transgenic mammalian species which may serve as eukaryotic
CC hosts for production of SCF and SCF products in quantity. The SCF is
CC useful for treating haematopoietic disorders, e.g., aplastic anaemia,
CC paroxysmal nocturnal haemoglobinuria, myelofibrosis, myelosclerosis,
CC osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma,
CC Hodgkin's disease, lymphoma, Gaucher's disease, Niemann-Pick disease,
CC Letterer-Siwe disease, refractory erythroblastic anaemia, Di Guglielmo
CC syndrome, congestive splenomegaly, Kala awar, sarcoidosis, primary
CC splenic pancytopenia, miliary tuberculosis, disseminated fungus disease,
CC Fulminating septicaemia, malaria, vitamin B 12 and folic acid deficiency,
CC pyridoxine deficiency, Diamond Blackfan anaemia, and hypopigmentation
CC disorders such as piebaldism and vitiligo. The SCF are also useful for
CC treating neurological damage, infertility states, intestinal damage
CC resulting from irradiation or chemotherapy, and AIDS. SCF is also useful
CC for enhancing haematopoietic recovery after acute blood loss and as a
CC boost to the immune system for fighting neoplasia (cancer). The present
CC sequence is a universal SCF PCR primer used in the isolation of SCF DNA.

PT Molecular indexing of DNA - using restriction enzymes, PCR amplification
PT and electrophoresis to analyse DNA fragments.
XX
PS Claim 3; Page 14; 20pp; English.
XX
SQ AAT33701-T33703 represent amplification primers used in the reverse-
transcription of tissue or cell derived mRNA, in the method of the
invention. The method of the invention is a molecular indexing method,
and comprises digesting the cDNA amplified by these sequences with a
class IIS restriction enzyme. Each resultant cDNA fragment is then
ligated to a biotinylated adaptor (selected from a pool of 64 adaptors
cohesive to all possible overhangs), and digesting the products with two
further class IIS restriction enzymes. These steps are repeated (but the
enzyme used for the first step is different in each) to produce two
further cDNA samples. The ligation samples are then recovered using
streptavidin-coated paramagnetic beads, removing the strand complementary
to an adaptor-primer. The adaptor primer and an anchored oligo-dT primer
(such as this sequence) are then used to amplify the cDNA samples. The
amplified products are separated, and the sizes of the fragments obtained
is recorded. The method can be used for the analysis and diagnosis or
diseases such as cancers or viral infections, for the search and
isolation of the genes of physiologically active substances that are
potential pharmaceuticals, or causative genes of hereditary diseases, as
well as for the isolation of genes for improving agricultural products.
Using this method, it is possible to classify (index) DNA into groups in
a short period of time without duplication

PT Determination of gene expression levels - using combinations of different
PT cDNA samples tagged with different PCR adaptors.
XX
PS Example 2; Page 9; 22pp; English.
XX
SQ The present sequence represents a primer which was used to synthesise
Apolipoprotein cDNA in a RT-PCR reaction. This primer as well as primers
AAV61555 and AAV61556 were added to both mouse liver-derived and mouse
kidney-derived total RNA to generate single-stranded cDNA. These primers
were used in the method of the invention to determine the amount ratio
between a cDNA coding for mouse liver-derived Apolipoprotein and a cDNA
that codes for the mouse kidney-derived Apolipoprotein by using Adaptor-
tagged Competitive PCR (ATAC-PCR). This method allows gene expression to
be quantitatively determined, and because internal standards are not
required to prepare a calibration curve, it is a quicker and less
laborious process

CC The present invention relates to a method for stimulating an immune
CC response. The method comprises administering an immunostimulatory nucleic
CC acid to a non-rodent subject in sufficient quantity to stimulate an
CC immune response. The present sequence is one such immunostimulatory
CC nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
CC (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects
CC against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
CC and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,
CC haemophilus, campylobacter, clostridium, Escherichia coli and/or
CC staphylococcus), fungal antigens and/or parasitic antigens. The method is
CC also useful for preventing cancer, asthma, infectious disease, allergy or
CC immune deficiency. The present sequence can also be used to redirect a
CC Th2 to a Th1 immune response and to activate immune cells. Note: the
CC present sequence may have a phosphorothioate backbone

PT Comparative detection of the amounts of RNA and DNA.
XX
PS Disclosure; Page 9; 9pp; Japanese.
XX
CC The present invention describes a method for the comparative detection of
CC the amount of an RNA. The method comprises: (a) cDNAs obtained by
CC transcribing respectively from at least two tissue RNAs are respectively
CC fragmented by using a same restriction enzyme; (b) each different adaptor
CC and a common adaptor are added to each of the cDNA fragments derived from
CC the same or different tissues by the step (a); (c) the resultant adaptor-
CC added cDNAs are mixed together; (d) an adaptor primer having the common
CC sequence to said different adaptor and a gene-specific adaptor are used
CC to amplify said adaptor-added cDNAs containing no region derived from
CC polyadenylic acid of the mRNA before the addition of the adaptor among
CC the adaptor-added cDNAs prepared by the step (b); (e) the ratios of the
CC cDNA amounts are measured between the tissues; (f) the RNA is detected
CC from the measured result; (g) each different adaptor and a common adaptor
CC are added to each of the genomic DNA fragments derived from a same or
CC different individuals; (h) the resultant adaptor-added genomic DNAs are
CC mixed together; (i) the adaptor-added genomic DNAs are amplified by using
CC an adaptor primer having the common sequence to the different adaptor and
CC a sequence-specific adaptor; and (j) the ratios of the amplified amounts
CC of the genomic DNAs are measured between the individuals. The method is
CC used for the detection of the amounts of RNA and DNA. The present
CC sequence represents an oligonucleotide which is used in the

XX PT New immunostimulatory oligonucleotide comprising non-palindromic nucleic
PT acid sequence motif, useful for inducing B-cell activation, treating,
PT preventing or ameliorating immune system disorder or tumoral disease e.g.
XX melanoma.
PS Example 17; Page 80; 139pp; English.
XX CC This invention relates to novel immunostimulatory oligonucleotides that
CC contain a non-palindromic sequence motif. Specifically, it refers to DNA
CC oligonucleotides (without a CpG motif), which can stimulate an immune
CC response in animals of the order of primate, including humans. The immune
CC response is characterised by the proliferation, differentiation, cytokine
CC and antibody production in plasmacytoid dendritic cells. The present
CC invention describes immunomodulator compositions that also comprise an
CC antigen selected from, for example, viruses, bacteria, parasites, tumour
CC cells and glycolipids. As such, these DNA oligos can be used in gene
CC therapy for inducing B-cell activation, treating, preventing or
CC ameliorating an immune system disorder or a tumoural disease including
CC chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell
CC carcinoma. This oligonucleotide sequence is a non-CpG DNA oligo of the
XX invention.

PT New stem cell factor polypeptide(s) - for stimulating the growth of
PT primitive progenitor cells, esp. for treating disorders involving blood
PT cells.
XX
PS Example 3; Fig 12C; 127pp; English.
XX

CC AAT04915-T04922 are oligonucleotide primers and probes used for the
CC amplification and sequencing of mammalian stem cell factor (SCF). Non-
CC naturally occurring SCF and C-terminally truncated polypeptides, having
CC amino acid sequences sufficiently duplicative of naturally occurring SCF,
CC stimulate growth of primitive progenitors such as haematopoietic
CC progenitor cells, neural stem cells and primordial germ stem cells. The
CC peptides can be used in a composition for treating leucopenia, anaemia or
CC thrombocytopenia, for enhancing engraftment of bone marrow during
CC transplantation or for bone marrow recovery after chemotherapy or
CC radiation-induced bone marrow aplasia or myelosuppression. They can also
CC be used for treating neoplasia, nerve damage, infertility, intestinal
CC damage or myeloproliferative disorders. Antibodies may be raised against
CC the peptides for use in detection or neutralisation of SCF in serum. SCF
CC may be useful for the treatment of AIDS and severe combined
CC immunodeficiency (SCID) states alone or in combination with other factors
CC such as IL-7. (Updated on 25-MAR-2003 to correct PF field.)

PT Production of hematopoietic cells suitable for administration to a
PT subject using progenitor cells and expanding the cells using stem cell
PT factor.
XX
PS Example 3; Fig 12C; 123pp; English.
XX

CC A method has been developed of making haematopoietic cells suitable for
CC administration to a subject. The method comprises: (a) obtaining
CC haematopoietic progenitor cells from a donor; and (b) expanding the cells
CC by adding to the cells a haematopoietically effective dose of a
CC polypeptide product having at least part of the primary structural
CC confirmation and one or more of the biological properties of naturally
CC occurring stem cell factor (SCF). The method is useful for stimulating
CC primitive progenitor cells including early haematopoietic progenitor
CC cells which are capable of maturing to erythroid, megakaryocyte,
CC granulocyte, lymphocyte and macrophage cells. SCF results in absolute
CC increases in haematopoietic cells of both myeloid and lymphoid lineages.
CC SCF is useful for treating haematopoietic disorders. The method is useful
CC for expanding early haematopoietic progenitors in syngeneic, allogeneic
CC or autologous bone marrow transplant. SCF is useful for enhancing the
CC efficiency of gene therapy based on transfecting haematopoietic stem
CC cells. SCF is also useful for combating the myelosuppressive effects of
CC anti-HIV drugs such as AZT and for enhancing haematopoietic recovery
CC after acute blood loss and as a boost to the immune system for fighting
CC neoplasia (cancer). The present sequence represents a universal
CC oligonucleotide which is used in an example from the present invention

PT Isolated DNA sequence, encoding polypeptide product useful for
PT stimulating growth of early hematopoietic progenitor cells.
XX PS Example 3; Fig 12C; 167pp; English.
XX CC The present sequence for universal PCR primer 220-7 is 1 of 8 universal
CC oligonucleotides (AAS04211-AAS04218) used in the isolation of the human
CC SCF (stem cell factor) cDNA sequence. The present invention relates to
CC novel stem cell factors (AAU02761-AAU02767, AAU02770-AAU02775, AAU02797)
CC and the polynucleotides encoding them. SCF stimulate primitive progenitor
CC cells including early haematopoietic progenitor cells. The invention also
CC describes SCF peptides (AAU02777-AAU02794) and the oligonucleotides
CC (AAS04182-AAS04210) used in the isolation of human and rat SCF sequences.
CC The polynucleotide encoding SCF is useful for producing SCF and useful in
CC gene therapy. It is useful for treating disorders involving blood cells
CC such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple
CC myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, anaemia,
CC congestive splenomegaly, Kala azar, sarcoidosis, military tuberculosis,
CC disseminated fungus disease, Fulminating septicemia, malaria, vitamin B12
CC and folic acid deficiency, pyridoxine deficiency, and hypopigmentation

DR Increasing the number of early hematopoietic progenitor cells in the
XX peripheral blood useful for the treatment of blood disorders including
PT Hodgkin's disease comprises the administration of human stem cell factor.
PT Example 3; Fig 12C; 210pp; English.
PS The present sequence for universal PCR primer 220-7 is 1 of 19 PCR
XX primers (AAS10435-AAS10453) used to amplify various portions of the human
CC SCF cDNA sequence. The sequence is described in an invention relating to
CC novel stem cell factors, the polynucleotides encoding them and methods
CC for producing the stem cell factors. The methods involve increasing the
CC number of early haematopoietic progenitor cells in human peripheral blood
CC by administering a haematopoietically effective human stem cell factor
CC polypeptide. The methods are useful for the treatment of blood disorders,
CC including myelofibrosis, myelosclerosis, osteopetrosis, metastatic
CC carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease,
CC lymphoma, Gaucher's disease, Niemann-Pick disease, refractory anaemia,
CC malaria, vitamin B12 and folic acid deficiency, hypopigmentation
CC disorders i.e. piebaldism and viral induced disorders, including AIDS

CC stages comprising identification of full length HBV transcripts (I) and
CC truncated HBV transcripts (II) in a serum sample, where the ratio of I:II
CC is indicative of a particular infection stage. The method is useful for
CC diagnosing HBV infection stages and determining the risk for developing
CC hepatocellular carcinoma. The present sequence is that of a HBV
CC diagnostic PCR primer, useful for the invention

XX DR New non-natural stem cell factor, useful for treating e.g. leucopenia or
XX immune deficiency, also related nucleic acid and antibodies.
XX PT Disclosure; SEQ ID NO 33; 217pp; English.
XX PS The invention relates to stem cell factor (SCF) polypeptides with
CC haematopoietic activity and the polynucleotides encoding them. The
CC polypeptides are used for treating infertility, intestinal damage,
CC myeloproliferative disorders, leucopenia, thrombocytopenia or anaemia,
CC for improving engraftment of bone marrow transplants, for enhancing bone
CC marrow recovery after radiotherapy or chemotherapy and in treatment of
CC immune deficiency, neoplasia, nerve damage, osteoporosis, metastatic
CC carcinoma, leukaemia and miliary tuberculosis. The SCF polypeptides are
CC also used to expand haematopoietic progenitor cells for transplantation
CC and to prepare such cells for transfection with a gene. The SCF
CC polynucleotides can be used for recombinant expression of the
CC polypeptides and also as probes for mapping of the SCF gene, for
CC identifying SCF-related diseases and as a marker for neighbouring genes.
CC Antibodies raised against the polypeptides are useful in diagnosis and to
CC remove SCF from blood. This sequence represents SCF related DNA of the
CC invention.

XX XX

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 3508; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of ubiquinone or
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

XX Pharmaceutical composition for treating asthma, has antisense
PT oligonucleotide containing less percentage of adenosine, targeted to
PT nucleic acids associated with lung airway or lung dysfunction, and
PT bronchodilating agent.
XX

PS Claim 15; SEQ ID NO 4482; 763pp; English.

XX This invention describes a novel composition (a) a first active agent,
PS comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

PT	Pharmaceutical composition for treating asthma, has antisense
PT	oligonucleotide containing less percentage of adenosine, targeted to
PT	nucleic acids associated with lung airway or lung dysfunction, and
PT	bronchodilating agent.
XX	
PS	Claim 15; SEQ ID NO 4788; 763pp; English.
XX	
CC	This invention describes a novel composition (a) a first active agent,
CC	comprising oligonucleotides, effective for alleviating
CC	bronchoconstriction, respiratory tract inflammation, allergies and
CC	reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC	surfactant depletion or hyposecretion, when administered to a mammal. The
CC	oligonucleotides are derived from a gene encoding or regulating
CC	expression of a target polypeptide associated with lung airway or lung
CC	dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC	The invention also describes a kit, that comprises: (a) a delivery
CC	device, in separate containers, (b) the oligonucleotides, (c)
CC	instructions for adding a carrier and for use of the kit. The composition
CC	of the invention has antiallergic, antiinflammatory, antiasthmatic, is a
CC	analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC	beta-adrenergic agonist. The composition is useful for preventing or
CC	treating a respiratory, lung or malignant disease. The administered
CC	composition comprises oligo and is administered to reduce the production
CC	or availability, or to increase the degradation of the target mRNA or to
CC	reduce the amount of target polypeptide present in the lungs. The
CC	pulmonary obstruction, and/or bronchoconstriction and/or lung
CC	inflammation, allergies and/or surfactant hypoproduction are associated
CC	with a disease or condition such as pulmonary vasoconstriction,
CC	inflammation, allergies, asthma, impeded respiration, respiratory
CC	distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC	hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC	transplantation rejection, pulmonary infections, bronchitis or cancer.
CC	The reduced adenosine content of the anti-sense oligos corresponding to
CC	thymidines present in the target RNA serves to prevent the breakdown of
CC	the oligonucleotides into products that free adenosine into the system
CC	e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC	prevent any unwanted effects due to it

CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system

PT New antisense compound targeted to a nucleic acid molecule encoding
PT mammalian glucocorticoid receptor, useful for treating diabetes, obesity,
PT cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
XX
PS Claim 4; SEQ ID NO 4234; 985pp; English.
XX

CC The invention comprises an antisense oligonucleotides that are targeted
CC to nucleic acids encoding a mammalian glucocorticoid receptor. The
CC antisense oligonucleotides of the invention are useful for preventing or
CC delaying infection, inflammation or tumour formation. The antisense
CC oligonucleotides are also useful for treating diabetes, obesity,
CC cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The
CC present DNA sequence represents an antisense oligonucleotide that targets
CC the human glucocorticoid receptor gene. NOTE: The present sequence
CC contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.

PT Novel intercalator, useful as electrochemical double stranded DNA
PT detection reagent.
XX
PS Example 1; Page 23; 24pp; Japanese.

CC The invention relates to a novel intercalator having a specific formula.
CC The intercalator of the invention may be useful for the electrochemical
CC detection of a gene, as an electrochemical double stranded DNA detection
CC reagent and as an intercalator for inhibiting the influence of mismatch
CC DNA and single stranded DNA. The intercalator enables the transission of
CC electronic transition between two base pairs to occur efficiently. The
CC current sequence is that of the electrochemical detection intercalator-
CC related DNA 2 of the invention.

XX New antisense oligonucleotides encoding mitONEET, useful for modulating

PT mitONEET expression or for treating diseases associated with mitONEET,

PT e.g. diabetes, immunological disorders or cardiovascular disorders.

XX

PS Claim 4; SEQ ID NO 87; 226pp; English.

XX

CC The invention comprises antisense oligonucleotides that are targeted to

CC the nucleic acids encoding a family of human proteins from mitochondrial

CC membranes, which bind insulin sensitising, antidiabetic

CC thiazolidinediones (referred to as: mitONEET). The antisense

CC oligonucleotides of the invention are useful for modulating mitONEET

CC expression and for treating diseases or conditions associated with

CC mitONEET, such as: diabetes, immunological disorders, cardiovascular

CC disorders including hypertension, neurological disorders, and

CC ischaemia/reperfusion injuries. The present DNA sequence represents a

CC mitONEET-specific antisense oligonucleotide of the invention. NOTE: The

CC present sequence is a 2'-methoxyethyl (2'-MOE) gapmer with a

CC phosphorothioate backbone.

PT Preparing a human stem cell factor (SCF) polypeptide, useful for treating

PT hematopoietic disorders, e.g., aplastic anemia, comprises growing host

PT cells transformed or transfected with DNA encoding a human SCF.

XX

PS Example 3; SEQ ID NO 33; 210pp; English.

XX

CC The invention relates to preparing a (vertebrate) human stem cell factor

CC (SCF) polypeptide comprising growing host cells transformed or

CC transfected with DNA encoding a human SCF that stimulates growth of

CC haematopoietic progenitor cells under nutrient conditions, the DNA being

CC operatively linked to an expression control sequence, and isolating the

CC polypeptide produced. Also included is a recombinant host cell

CC transformed or transfected with an expression construct comprising a

CC vertebrate SCF polypeptide-encoding DNA operatively linked to a

CC heterologous expression regulatory sequence, permitting the expression of

CC the vertebrate SCF polypeptide in the host cell. Disclosed as new are rat

CC and human nucleic acids encoding SCF, SCF proteins from a number of other

CC mammals and recombinantly expressed SCF protein fragments. The DNA

CC sequences are useful for effecting the large scale synthesis of SCF by a

CC variety of recombinant techniques or for generating new and useful viral

CC and circular plasmid DNA vectors, new and useful transformed and

CC transfected prokaryotic and eukaryotic host cells, and new and useful

CC methods for cultured growth of such host cells capable of expression of

CC SCF and its related products. The DNA sequences are also useful as

CC labelled probes in isolating human genomic DNA encoding SCF, in methods

CC of protein synthesis, in genetic therapy in humans and other mammals, and

CC in developing transgenic mammalian species which may serve as eukaryotic

CC hosts for production of SCF and SCF products in quantity. The SCF is

CC useful for treating haematopoietic disorders, e.g., aplastic anaemia,

CC paroxysmal nocturnal haemoglobinuria, myelofibrosis, myelosclerosis,

CC osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma,

CC Hodgkin's disease, lymphoma, Gaucher's disease, Niemann-Pick disease,

CC Letterer-Siwe disease, refractory erythroblastic anaemia, Di Guglielmo

CC syndrome, congestive splenomegaly, Kala awar, sarcoidosis, primary

CC splenic pancytopenia, miliary tuberculosis, disseminated fungus disease,

CC Fulminating septicaemia, malaria, vitamin B 12 and folic acid deficiency,

CC pyridoxine deficiency, Diamond Blackfan anaemia, and hypopigmentation

CC disorders such as piebaldism and vitiligo. The SCF are also useful for

CC treating neurological damage, infertility states, intestinal damage

CC resulting from irradiation or chemotherapy, and AIDS. SCF is also useful

CC for enhancing haematopoietic recovery after acute blood loss and as a

CC boost to the immune system for fighting neoplasia (cancer). The present

CC sequence is a universal SCF PCR primer used in the isolation of SCF DNA.

PT Sorting single-stranded nucleic acid, useful for analyzing expression
PT patterns and screening active agents, uses capture agent with variable
PT and constant regions.
XX
PS Example; Page 5; 8pp; German.
XX
CC This invention describes a novel method for sorting single-stranded
CC nucleic acids by isolation and hybridisation of nucleic acid pools, then
CC reading out, where the nucleic acids are selectively bound using capture
CC agents that are (a) immobilised on the surface of a solid matrix and (b)
CC comprise variable and non-variable regions. The capture oligonucleotides
CC have a 5'-invariable anchor region, the complement of which is present at
CC least once in each nucleic acid and a 3'-variable, discriminatory region
CC that comprises all possible combinations of up to 10 nucleotides to allow
CC binding of particular sorts of single stranded nucleic acids. The capture
CC agents are particularly locked nucleic acids (LNA) and the anchor region
CC comprises a sequence of 10-50, particularly 15-25, T residues. The
CC capture oligonucleotides are biotinylated and immobilised on a surface by
CC interaction with streptavidin. The matrix is of plastic, ceramic, glass,
CC metal, resin, gel, crystalline material and/or membrane, having semi-
CC conducting properties and especially in the form of a chip. Its surface
CC is particularly a layer of (bio)molecular filaments and binding of single
CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular,
CC physical, stimulated by an electrical field or through a molecular sieve.
CC The method is used (i) for analysis of patterns, especially in mucosal,
CC hair root, blood, nerve or germ cells and (ii) for determining the
CC activity of pharmaceuticals and/or nutritional compounds, e.g. food
CC additives or supplements, especially minerals, trace elements, organic
CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and
CC mixtures. The method provides rapid, inexpensive and reproducible
CC representation of differences in pools of nucleic acids from cells. It
CC allows imaging of the complete pattern of all nucleic acid in a cell, and
CC can detect very small differences in the nucleic acid pool. Since the
CC method is based on comparison of nucleic acid pools, not individual
CC genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent
CC capture probes used in the method of the invention.

CC This invention describes a novel method for sorting single-stranded
CC nucleic acids by isolation and hybridisation of nucleic acid pools, then
CC reading out, where the nucleic acids are selectively bound using capture
CC agents that are (a) immobilised on the surface of a solid matrix and (b)
CC comprise variable and non-variable regions. The capture oligonucleotides
CC have a 5'-invariable anchor region, the complement of which is present at
CC least once in each nucleic acid and a 3'-variable, discriminatory region
CC that comprises all possible combinations of up to 10 nucleotides to allow
CC binding of particular sorts of single stranded nucleic acids. The capture
CC agents are particularly locked nucleic acids (LNA) and the anchor region
CC comprises a sequence of 10-50, particularly 15-25, T residues. The
CC capture oligonucleotides are biotinylated and immobilised on a surface by
CC interaction with streptavidin. The matrix is of plastic, ceramic, glass,
CC metal, resin, gel, crystalline material and/or membrane, having semi-
CC conducting properties and especially in the form of a chip. Its surface
CC is particularly a layer of (bio)molecular filaments and binding of single
CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular,
CC physical, stimulated by an electrical field or through a molecular sieve.
CC The method is used (i) for analysis of patterns, especially in mucosal,

CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular,
CC physical, stimulated by an electrical field or through a molecular sieve.
CC The method is used (i) for analysis of patterns, especially in mucosal,
CC hair root, blood, nerve or germ cells and (ii) for determining the
CC activity of pharmaceuticals and/or nutritional compounds, e.g. food
CC additives or supplements, especially minerals, trace elements, organic
CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and
CC mixtures. The method provides rapid, inexpensive and reproducible
CC representation of differences in pools of nucleic acids from cells. It
CC allows imaging of the complete pattern of all nucleic acid in a cell, and
CC can detect very small differences in the nucleic acid pool. Since the
CC method is based on comparison of nucleic acid pools, not individual
CC genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent
CC capture probes used in the method of the invention.

PT New isolated limonene hydroxylase nucleic acids - which encode limonene-6
PT -hydroxylase and limonene-3-hydroxylase, which can be used to produce
PT trans-carveol and trans-isopiperitenol.
XX
PS Example 4; Page 27; 80pp; English.
XX
CC The invention relates to nucleotide sequences encoding spearmint (-)-
CC limonene-6-hydroxylase (L6H) and peppermint (-)-limonene-3- hydroxylase
CC (L3H). Host cells containing a vector comprising the nucleotide sequences
CC can be used for the recombinant production of limonene hydroxylases or of
CC primary enzyme products. The primary enzyme products are trans-carveol in
CC the case of (-)-L6H or trans-isopiperitenol in the case of (-)-L3H, which
CC are of subsequent use, to obtain enhanced expression of limonene
CC hydroxylase in plants to attain enhanced trans- carveol or trans-
CC isopiperitenol production as a predator or pathogen defense mechanism,
CC attractant or environmental signal. The limonene hydroxylase cDNAs also
CC provide a useful tool for isolating other monoterpene hydroxylase genes
CC and for examining the developmental regulation of monoterpene
CC biosynthesis. Sequences AAX06564-73 represent primers for the PCR
CC amplification of (-)-limonene-6-hydroxylase cDNA

CC The present primer was used to reverse transcribe cDNA encoding a C-20
CC oxidase. The amplifie fragment is used in the method of the invention.
CC The specification describes methods for the inhibition and control of
CC gibberellic acid levels. Gibberellic acid levels may be inhibited or
CC controlled by use of a chimeric expression construct expressing a RNA or
CC protein which suppresses the gibberellin biosynthetic pathway sequence,
CC diverts substrate from the pathway, or degrades pathway substrates or
CC products. The methods uses copalyl diphosphate synthase, 3beta-
CC hydroxylase, 2-oxidase, phytoene synthase, C-20 oxidase, and a
CC 2beta,3beta-hydroxylase polynucleotides to achieve this. The method is
CC used to control seed germination and seedling growth especially to
CC regulate gene products of gibberellin and seedling growth especially to
CC restoration of normal seed germination, in transgenic plants. The plants
CC produced are gibberellin deficient, and have shortened hypocotyl and/or
CC epicotyl phenotypes compared to normal plants

PT New neuroleptic-regulated polynucleotides expressed in the central
PT nervous system for diagnosing and treating neuropsychiatric disorders
PT such as schizophrenia, bipolar disorder and addiction-related behavior.
XX
PS Example 1; Page 87; 210pp; English.
XX
CC The present invention describes isolated neuroleptic-regulated nucleic
CC acid molecules. (I) have neuroleptic, antimanic and antidepressant
CC activities, and can be used in gene therapy. (I), polypeptides (II)
CC encoded by (I), or a host cell (III) comprising (I), are useful for
CC preventing, treating, modulating or ameliorating a medical condition such
CC as a neuropsychiatric disorder. (I) are useful as diagnostic agents for
CC diagnosing a pathological condition or susceptibility to a pathological
CC condition such as neuropsychiatric disorder e.g. schizophrenia, a bipolar
CC disorder or addiction-related behaviour. (I) are useful for detecting the
CC presence of a nucleic acid encoding a protein in a mammalian tissue
CC sample. (I) can be used as probes and primers, for chromosome
CC identification, to control gene expression through triple helix formation
CC or antisense DNA or RNA, in gene therapy to treat the above mentioned
CC disorders, identifying individuals from minute biological samples, as an
CC alternative to restriction fragment length polymorphism (RFLP) and as
CC polymorphic markers for forensic purposes. (I) is also useful as
CC molecular weight markers on Southern gels, diagnostic probes for the
CC presence of specific mRNA in a particular cell type, as a probe to
CC subtract-out known sequences in the process of discovering novel
CC polynucleotides, for selecting and making oligomers for attachment to a
CC gene chip or other support, to raise anti-DNA antibodies using DNA
CC immunisation technique, and as an antigen to elicit an immune response.

XX

CC The present sequence represents a primer used to isolate novel mouse
CC microglia and macrophage regulatory gene DST (digital sequence tag)
CC sequences. AAS06401-AAS06590 represent these novel sequences and the
CC primer sequences used to isolate them. The PCR-based total gene
CC expression analysis (TOGA) system is used to examine the expression
CC pattern of molecules corresponding to genes that are regulated in
CC unstimulated microglia, activated microglia, unstimulated macrophage and
CC activated macrophage. The polynucleotides of the invention, the
CC polypeptides encoded by them and antibodies that bind to these
CC polypeptides are useful for the diagnosis, prevention,
CC treatment or amelioration of a medical condition, preferably a
CC neuroinflammatory pathology or a neurodegenerative disease such as

CC Alzheimer's disease, senile dementia, Parkinson's disease, obsessive
CC compulsive disorders, epilepsy, schizophrenia, multiple sclerosis,
CC depression and bipolar manic-depressive disorder. The sequences and
CC methods of the invention can also be used for detecting or treating
CC infectious disorders (e.g. AIDS), hyperproliferative disorders (e.g.
CC cancer), immune disorders (e.g. severe combined immunodeficiency, SCID)
CC autoimmune diseases (e.g. insulin dependent diabetes mellitus),
CC inflammatory disorders (e.g. arthritis). The polynucleotides can be used
CC for gene therapy

PT modulating or ameliorating a medical condition such as psychoses or a
PT neuro psychiatric disorder e.g. schizophrenia, or a bipolar disorder in a
PT mammal.
XX

PS Example 1; Page 40; 254pp; English.

XX This invention relates to the cDNA sequences of novel isolated
CC polynucleotides associated with psychoses or other neuropsychiatric
CC disorders. The sequences of the invention may act as blockers of D₂
CC receptors in the meso-limbic dopamine system. The nucleotide sequences of
CC the invention and the polypeptides encoded by them are useful in the
CC manufacture of a medicament useful for preventing, treating, modulating
CC or ameliorating a medical condition e.g. a neuropsychiatric disorder. An
CC antibody that binds the proteins of the invention is useful for
CC preventing, treating, modulating or ameliorating neurological disorders
CC such as psychoses or other neuropsychiatric disorders in a subject. The
CC sequences are also useful for diagnosing neurological disorders or a

CC susceptibility to a neurological disorder such as psychoses and other
CC neuro psychiatric disorders in a subject by determining the presence or
CC absence of mutation in the nucleotide sequence of apolipoprotein D or by
CC determining the alteration (increase or decrease) in the expression of
CC apolipoprotein D. The sequences of the invention are useful in treating
CC deficiencies or disorders of the central nervous system or peripheral
CC nervous system by activating or inhibiting the proliferation,
CC differentiation or mobilisation (chemotaxis) of neuroblasts, stem cells
CC or glial cells. The sequences are useful as a marker or detector of a
CC particular nervous system disease or disorder such as Alzheimer's
CC disease, Pick's disease, Binswanger's disease, other senile dementia,
CC Parkinson's disease, obsessive compulsive disorders, epilepsy,
CC encephalopathy, ischaemia, addiction, multiple sclerosis, depression and
CC manic-depressive disorder. The present sequence represents an
CC oligonucleotide primer used in the identification of the cDNA sequences
CC of the invention

XX
CC The present invention describes an isolated polynucleotide (I) and its
CC complements, and degenerate variants, comprising a sequence selected from
CC those given in ABQ73206 to ABQ73222 (NS), which is a digital sequence tag
CC (DST) corresponding to mRNAs whose expression is regulated by
CC proliferative lesion development caused by mechanically induced intimal
CC hyperplasia, or by lercanidipine treatment, or by proliferative lesions
CC and reversed by lercanidipine treatment. (I) has antiatherosclerotic
CC activity and can be used in gene therapy. (I) can be used for diagnosing
CC a medical condition (e.g. atherosclerosis) in a subject which involves

CC determining the presence or absence of a mutation in (I) and diagnosing
CC the medical condition based on the presence or absence of the mutation.
CC (I) is also useful for diagnosing atherosclerosis, or the susceptibility
CC to atherosclerosis in a subject which involves detecting an alteration
CC (an increase or decrease) in amount of expression of (I). (I) is also
CC useful for diagnosing or monitoring the effects of treating a subject
CC with dihydropyridine calcium antagonist e.g., lercanidipine. (I) can also
CC be used for preventing, treating, modulating, or ameliorating a medical
CC condition such as atherosclerosis in a mammalian subject. The present
CC sequence represents a TOGA primer which is used in the exemplification of
CC the present invention

XX
CC The present invention relates to a method for preventing, treating,
CC modulating or ameliorating a medical condition. The method involves
CC administering one or more nucleic acid molecules up- or down-regulated in
CC hepatitis B virus (HBV) infection or polypeptides encoded by the nucleic
CC acid molecules or antibodies that bind to the polypeptide. The method is
CC useful for preventing, treating, modulating or ameliorating a medical
CC condition. It is also useful for determining the presence or absence of a
CC mutation in the nucleic acid molecules or detecting an alteration in
CC expression of the polypeptide which is useful for the diagnosis of
CC hepatitis viral infection. The method is useful for assessing the stage
CC of hepatitis viral infection (e.g., acute hepatitis versus chronic
CC hepatitis) or assessing the efficacy or toxicity of therapeutic treatment
CC for hepatitis viral infection and a gene expression profile is useful for

CC identifying polypeptides and polynucleotides which are associated with
CC hepatitis viral infection. Sequences of the invention are used in gene
CC therapy and as vaccines. Nucleic acid sequences are useful as a
CC diagnostic markers for HBV infection and for treating infectious
CC diseases. The present DNA sequence is a PCR primer which is used for
CC direct sequencing of TOGA (Total Gene expression Analysis) generated PCR
XX products

Control of gibberellin levels in plants useful to avoid unfavorable
conditions in crops to increase yields, using transgenic plants having
reduced seed germination and early seedling growth then treatment to
restore these properties.

Example 19; Page 104; 155pp; English.
The invention relates to control of gibberellin (GA) levels in plants.
The method involves producing transgenic plants having a phenotype of
reduced seed germination and reduced early seedling growth, then
restoring seed germination and early seedling growth by treating plants
with an appropriate compound when conditions are favourable. The method
is useful to control seed germination and/or early seedling growth in
agricultural production so that unfavorable environmental conditions
normally reducing agronomic output can be avoided and yields increased.
Plants also demonstrate increased uniformity of germination, emergence
and seedling vigor, so increasing yields at harvest. The method is
especially useful in crop plants such as e.g. canola, soybean, cotton,
etc., and is also useful in storage and transport of seeds to reduce
premature germination which may affect agronomic or food quality of the
seeds. The present sequence is a PCR primer used to isolate pumpkin 2beta
-3beta hydroxylase cDNA. This primer is used in the exemplification of
the invention

PT New chimeric polypeptide comprising a histone acetyltransferase
PT polypeptide segment and a segment comprising a histone deacetylase
PT chromatin-associated protein complex subunit, useful for modulating gene
PT expression in cells.
XX
PS Example 10; Page 54; 85pp; English.

The specification describes chimeric histone acetyltransferase
polypeptides. The chimeric polypeptides comprise a polypeptide segment
that exhibits histone acetyltransferase activity, and a polypeptide
segment having 40% or greater sequence identity to a subunit of a histone
deacetylase chromatin-associated protein complex. The chimeric
polypeptides are useful for determining gene expression profiles in
specific cells, for modulating gene expression in specific cells, and for
making genetically modified eukaryotes. The present sequence represents a
reverse transcription primer used in the method of the invention

DR
XX The present invention describes a method for preventing or treating a
CC pathological condition (comprising ataxia telangiectasia (AT), AT tumours
CC or other cancers), which comprises administering to a mammalian subject
CC at least one of: (a) a first polynucleotide comprising a sequence having
CC 38-889 bp (consisting of the sequences in ACC79319 to ACC79392 (I)) or a
CC second polynucleotide at least 95% identical to the first polynucleotide;
CC (b) a third polynucleotide comprising at least 10-bp sequence that is
CC hybridisable to the first polynucleotide under stringent conditions; or
CC (c) a gene corresponding to any of (1)-(2) or another gene at least 95%
CC identical to the gene. (I) have cytostatic activities, and can be used in
CC vaccines and in gene therapy. The method is useful for preventing or
CC treating e.g., ataxia telangiectasia (AT), AT tumours or other cancers.
CC ACC79393 to ACC79423 represent primers used in the exemplification of the
CC present invention

XX
CC The invention relates to polynucleotides and polypeptides associated with
CC atherosclerosis. Polynucleotides of the invention are useful for delivery
CC of genes, DNA vaccines, diagnostic reagents, peptides, proteins or
CC macromolecules. Sequences of the invention are useful for treating
CC nervous system disorders (e.g., Alzheimer's disease, Parkinson's disease,
CC multiple sclerosis, epilepsy), immune disorders (e.g., autoimmune
CC disorders such as rheumatoid arthritis, Addison's disease, haemolytic
CC anaemia, graft-versus-host disease, inflammation), hyperproliferative
CC disorders (e.g., neoplasms) and infectious diseases (e.g., viral,
CC bacterial, fungal or parasite infection). They are used for regeneration
CC of tissues, to repair, replace or protect damage tissues, for increasing
CC chemotaxis activity of cells, for increasing or decreasing the
CC differentiation or proliferation of embryonic stem cells from a lineage,
CC for modulating mammalian characteristics, (such as body weight or
CC height), for modulating mammalian metabolism affecting catabolism,
CC anabolism, processing utilisation and storage of energy, to change a
CC mammal's mental or physical state, or as a food additive or preservative.
CC The invention is useful in gene therapy. The present sequence is a
CC sequencing primer used in the invention

PT New tumor-associated oligopeptide, useful particularly for treating
PT multiple myeloma, is recognized by CD8 cytotoxic T cells, also
PT derivatives and related nucleic acid.
XX
PS Disclosure; Page 22; 64pp; German.
XX
CC This invention describes a novel tumor-associated oligopeptide that is
CC recognized as an antigen by CD8+ cytotoxic T lymphocytes (CTL) and causes
CC CTL-induced lysis and/or apoptosis of tumor cells, especially multiple
CC myeloma cells. The oligopeptide is derived from human PRDI-BF1 (positive
CC regulatory domain I-binding factor-1) which is able to induce an MHC
CC (major histocompatibility complex) Class I allele variant A2-restricted
CC immune response of CD8+ CTL against tumor cells. The products of the
CC invention have cytostatic activity and can be used in a vaccine. The
CC peptide of the invention, also related retro-inverse and pseudopeptides,
CC fusion proteins (FP), polynucleotides, vectors, host cells and antibodies
CC and T cell receptors specific for PRDI-BF1 peptides are useful for
CC treating diseases associated with PRDI-BF1, particularly tumors. The
CC products of the invention are also useful as diagnostic, therapeutic and
CC prophylactic agents for detecting, modifying, generating, expanding
CC and/or regulating activation and functional status of T cells, and for
CC preparation of poly- or mono-clonal or recombinant A2-restricted T cell
CC receptors and their functional equivalents. This sequence represents an
CC RT-PCR primer used to amplify the human PRDI-BF1 gene described in the
CC invention.

PT Preparing a library of same-length signature sequences from a source
PT nucleic acid population by ligating to the cleaved ends, a second adapter
PT containing a recognition and cleavage site for a second restriction
PT endonuclease.

XX Disclosure; Fig 2a; 54pp; English.

PS This invention relates to a novel method for preparing a library of same-length signature sequences from a source nucleic acid population.

XX Specifically, it comprises producing solid phase cloned libraries of oligonucleotide tag-DNA signature sequence constructs, which are useful for sequencing many polynucleotides simultaneously. The present invention describes a kit for the construction of adapter-signature-adapter constructs using 'first' and 'second' adapters each containing a specific restriction endonuclease recognition site, and which flanks the same length signature sequence. As such, using the method described herein it is possible to do parallel sequencing of large populations of polynucleotides for genomic mapping, genetic identification and medical diagnostics. This oligonucleotide sequence is a DNA oligo involved in the step wise process of preparing a library of same length signature sequences from restriction fragments in an exemplification of the invention.

PT Analysis of DNA fragment - comprises addition of known common oligonucleotide, amplification of resultant DNA fragment and analysis and labelling of amplified DNA.

PT

XX

PS Example 5; Page 12; 17pp; Japanese.

XX

CC This invention describes a novel method for the analysis of a DNA fragment which comprises: (i) addition of a known common oligonucleotide sequence to at least one terminal of each DNA fragment, (ii) amplification of the resultant DNA fragment as a primer using a first common primer containing a complementary nucleotide sequence to the above mentioned known common oligonucleotide sequence, a second common primer containing a complementary nucleotide sequence to the prepared known common oligonucleotide sequence optionally having been introduced with complementary nucleotide sequence at a terminal, and a specific primer capable of hybridisation with a DNA fragment containing whole or part of the gene having known sequence, to give amplified DNA, (iii) analysis of the amplified DNA to find the information of the DNA fragment, in which the specific primer is designed to prepare fragments of the common first and second primers and to give short fragment of amplified DNA and (iv) labelling them to make their differentiation. Differentiation of informations of known and unknown genes readily provides information of unknown gene and simultaneous monitoring of signals derived from minor genes. Furthermore, labelling of DNAs according to functions of known genes can be performed. AAZ09189-209201 represent oligonucleotide primers used to illustrate the method of the invention

XX
PS Example; Page 12; 34pp; English.
XX
CC AAR62941 and AAR62942 are examples of synthetic immunoreactive peptides.
CC They are used in a method for detecting an antigen in a subject. The
CC method involves binding the antigen to a solid support and then reacting
CC it with an immunoreactive ligand (L) bound to an oligo; removing any
CC unreacted L, and then detecting the presence of the oligo. A similar
CC method can be used to detect Abs, in which case the ligand is an oligo-
CC labelled Ag. The use of an amplifiable oligo as the label allows Ag or Ab
CC to be detected at very low levels. An exemplary oligo is AAQ75024 which
CC can be covalently attached by the 5'- terminus to the N- or C-terminal of
CC a synthetic peptide. In the example, peptide AAR62941 was coupled to
CC oligo AAQ75024 using disuccinimidyl suberate. Serum samples suspected to
CC contain HEV Abs were immobilised on plastic tubes or wells, then
CC incubated for 30-60 mins with the peptide-oligo product. The vessels were
CC washed; bound oligo was released with 0.2M glycine and amplified in a
CC separate tube using as primers AAQ75025 and AAQ75026 in 30 cycles of PCR.
CC The amplification product - AAQ75031 - was treated with uracil DNA
CC glycosylase to remove the U18 fragment, and the product captured by
CC immobilised oligo-dT. (Updated on 25-MAR-2003 to correct PN field.)

XX Treating bacterial infections in humans or animals with
PT oligo:nucleotide(s) - resistant to nuclease and targetted to bacterial
PT nucleic acid or proteins, also conjugates of these oligo:nucleotide(s)
PT with antibiotics.

XX Claim 49; Page 87; 163pp; English.

XX This antisense oligonucleotide is nuclease resistant and can be used in
CC the treatment of animals, including humans, having a bacterial infection.
CC The treatment comprises administration of such nuclease resistant
CC oligonucleotides, targeted to a nucleic acid or protein of the bacterium,
CC and formulated with a carrier. A compound comprising this nuclease
CC resistant oligonucleotide can be covalently linked to an antibiotic. The
CC method is used to treat infections by a wide variety of Gram-positive and
CC Gram-negative, or acid-fast, bacteria, in human and veterinary medicine.
CC The methods are particularly used in immuno-compromised individuals (e.g.
CC patients with acquired immunodeficiency syndrome or those receiving
CC chemotherapy or radiation therapy), optionally in combination with, or
CC fused to, antiviral or other antimicrobial oligonucleotides. Apart from
CC therapeutic use, the oligonucleotides can be used to control bacteria in
CC laboratory cultures, foods, beverages and industrial processes. The
CC oligonucleotides are specific for bacteria, without affecting metabolism
CC in mammalian cells. They may also activate RNase H and have a general,
CC non-specific immune-stimulating effect. The oligonucleotides can be
CC administered orally, intranasally, rectally, topically or by injection,
CC optionally coupled to an agent (e.g. carbohydrate or polyamine) that
CC enhances cellular uptake

PT Therapeutic composition containing antisense oligonucleotides that
PT include arabinose sugars, particularly for inhibiting viral replication.
XX
PS Example 1; Page 29; 91pp; English.

The invention relates to a new composition for selective, sequence-
specific inhibition of gene transcription and expression in a host. The
composition comprises oligonucleotides containing arabinose sugars that
can hybridise to either a single-stranded (ss) RNA to induce RNase H
cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple
helix, thereby inhibiting DNA replication and/or transcription. The
oligoarabinonucleotides are used for antisense inhibition of gene
expression or to prevent DNA replication, or reverse transcription of RNA
by retroviruses. The compositions are therefore particularly used to
inhibit retroviral replication. The oligoarabinonucleotides can also be
used, in combination with RNase H, as reagents for sequence-specific
cleavage or RNA mapping, and additionally for the study and control of
gene expression in cells. The oligoarabinonucleotides have excellent
affinity for RNA, increased resistance to nucleases and show little if
any non-specific binding to cellular or serum proteins. They target ss
RNA, but not complementary ss DNA, so may be useful for targeting
retroviral genomic RNA to inhibit the early stages of viral replication.
Oligoarabinonucleotides containing pyrimidine bases form triple helices
with significantly higher thermal stability than those produced by normal
oligonucleotides. Sequences AAZ87160-287164 represent
oligoarabinonucleotides containing beta-D-arabinose used in an
exemplification of the present invention

PT Therapeutic composition containing antisense oligonucleotides that
PT include arabinose sugars, particularly for inhibiting viral replication.
XX
PS Example 2; Page 31; 9lpp; English.
XX
CC The invention relates to a new composition for selective, sequence-
CC specific inhibition of gene transcription and expression in a host. The
CC composition comprises oligonucleotides containing arabinose sugars that
CC can hybridise to either a single-stranded (ss) RNA to induce RNase H
CC cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple
CC helix, thereby inhibiting DNA replication and/or transcription. The
CC oligoarabinonucleotides are used for antisense inhibition of gene
CC expression or to prevent DNA replication, or reverse transcription of RNA
CC by retroviruses. The compositions are therefore particularly used to
CC inhibit retroviral replication. The oligoarabinonucleotides can also be
CC used, in combination with RNase H, as reagents for sequence-specific
CC cleavage or RNA mapping, and additionally for the study and control of
CC gene expression in cells. The oligoarabinonucleotides have excellent
CC affinity for RNA, increased resistance to nucleases and show little if
CC any non-specific binding to cellular or serum proteins. They target ss
CC RNA, but not complementary ss DNA, so may be useful for targeting
CC retroviral genomic RNA to inhibit the early stages of viral replication.
CC Oligoarabinonucleotides containing pyrimidine bases form triple helices
CC with significantly higher thermal stability than those produced by normal
CC oligonucleotides. Sequences AAZ87165-287169 represent
CC oligodeoxyarabinonucleotides containing 2'-deoxy-2'-fluoro-beta-D-
CC arabinose used in an exemplification of the present invention

PT Fibronectin scaffold protein array for obtaining a protein/compound which
PT binds to a compound/protein, comprises a fibronectin type III domain
PT having a randomized loop, a randomized beta-sheet or their combination.
XX

PS Disclosure; Page 25; 67pp; English.
XX
CC The present invention relates to an array of proteins (antibody mimics)
CC comprising a fibronectin type III domain having a randomised loop, a
CC randomised beta-sheet, or their combination, and has the capacity to bind
CC to a compound that is not bound by a corresponding naturally- occurring
CC fibronectin, immobilised onto a solid support. The antibody mimics is
CC useful for detecting a compound preferably a protein, in a biological
CC sample. It is also useful to detect one or more different analytes
CC simultaneously in a sample. Hence is useful for diagnostic purposes. It
CC is also useful for the purpose of designing proteins capable of binding
CC to virtually any compound of interest. The present sequence is an
CC oligonucleotide A18-2PEG linker used in an exemplification of the
CC invention

XX Producing binary sequence tags, useful for analyzing nucleic acid
PT sequence tags, gene expression or gene-expression patterns, involves
PT generating nucleic acid fragments, which are mixed with offset adaptors
PT and adaptor-indexers.

PS Disclosure; Page 101; 101pp; English.

XX The present invention describes a method of producing binary sequence
CC tags from nucleic acid fragments in a sample, involving incubating the
CC sample with cleaving reagents, mixing offset adaptors with the sample,
CC incubating with more cleaving reagents and mixing the sample with adaptor
CC -indexers where the adaptors are coupled to binary sequence tags. The
CC method is useful in sequence analysis, including analysis and comparison
CC of gene expression, nucleic acid samples and genomes

XX Novel secreted factor encoded by clone P00210D09 useful for diagnosing,

PT treating and/or preventing various cardiac, renal and inflammatory

PT diseases.

XX

PS Example 1; Page 41; 69pp; English.

XX

CC The present sequence corresponds to polylinker DNA of the phagemid vector

CC PCR2.1. It was used in the construction of a normalised rat cDNA library,

CC which was used in an example demonstrating differential expression of a

CC rat gene referred to as clone P00210D09. The invention relates to a

CC polypeptide comprising a sequence of at least 80% identity to residues 22

CC -122 of the present sequence, or a sequence encoded by a nucleic acid

CC hybridising under stringent conditions to the complement of the coding

CC region comprising 1031 nucleotides, and having at least one biological

CC activity of the polypeptide encoded by clone P00210D09. The polypeptides

CC and polynucleotides of the invention are useful for the treatment of

CC cardiac, renal and inflammatory diseases. The polynucleotides are useful

CC in antisense mediated gene inhibition and in gene therapy. The

CC polypeptides are useful in assays for identifying lead compounds that may

CC be used as therapeutic agents in the treatment of cardiac, kidney or

CC inflammatory diseases

XX

The present invention relates to novel polypeptides having cytotoxic
CC activity obtainable from sea hare Aplysia. Sequences of the invention are
CC useful for the manufacture of cytotoxic agents against apoptosis-
CC resistant cells, where the agents are useful for diagnosis, prevention,
CC treatment of disorders associated with dysfunctions of GAP-SH3 binding
CC protein, factors for generating or detoxifying reactive oxygen species
CC (ROS) and factors for blocking and/or by-passing of caspases. They are
CC useful for tumour therapy. Cytotoxic proteins of the invention are useful
CC for destroying tumours and/or selectively killing cells in tissues, for
CC identifying novel targets for the development of pharmaceutical agents,
CC preferably anti-tumour agents and as specific ion channel modulators,
CC e.g., blockers or openers for therapy, diagnostic or research. They are
CC useful for the diagnosis and therapy of hyperproliferative diseases,
CC preferably tumours, e.g., leukaemia, carcinoma, sarcoma and melanoma.
CC They are also useful for development of drugs for the treatment of
CC degenerative diseases such as Alzheimer's disease, Parkinson's disease,
CC arteriosclerosis, heart diseases, stroke and vascular diseases. The
CC present sequence is an oligonucleotide which is used for amplifying sea
CC hare cyplasin L DNA. This sequence is used in the exemplification of the
CC invention

DR Increasing efficiency of second strand cDNA synthesis using terminal
XX continuation model before performing further RNA amplification by RNA
PT transcription.
PT
XX
PS Example 7; Page 80; 128pp; English.
XX
CC This invention relates to a novel method for increasing the efficiency of
CC second strand cDNA synthesis through a mechanism of terminal
CC continuation. In the method an RNA molecule is obtained and a first
CC primer is added that comprises a region that hybridises to a
CC complementary region of the molecule before a second primer is added
CC comprising at least one riboguanine at the 3' end of the primer. A first
CC complementary nucleic acid molecule is synthesised, the RNA molecule and
CC second primer are removed and a second complementary nucleic acid
CC molecule is synthesised to form a second hybrid with an extension product
CC of the third primer bound to the first complementary molecule. The method
CC of the invention is useful for increasing the efficiency of second strand
CC cDNA synthesis and may be used for linear amplification of genetic
CC signals from histologically stained tissue. The present sequence
CC represents a poly d(T) PCR primer used in the method of the invention

XX
PS The present invention describes a method for the comparative detection of
CC the amount of an RNA. The method comprises: (a) cDNAs obtained by
CC transcribing respectively from at least two tissue RNAs are respectively
CC fragmented by using a same restriction enzyme; (b) each different adaptor
CC and a common adaptor are added to each of the cDNA fragments derived from
CC the same or different tissues by the step (a); (c) the resultant adaptor-
CC added cDNAs are mixed together; (d) an adaptor primer having the common
CC sequence to said different adaptor and a gene-specific adaptor are used
CC to amplify said adaptor-added cDNAs containing no region derived from
CC polyadenylic acid of the mRNA before the addition of the adaptor among
CC the adaptor-added cDNAs prepared by the step (b); (e) the ratios of the
CC cDNA amounts are measured between the tissues; (f) the RNA is detected
CC from the measured result; (g) each different adaptor and a common adaptor
CC are added to each of the genomic DNA fragments derived from a same or
CC different individuals; (h) the resultant adaptor-added genomic DNAs are
CC mixed together; (i) the adaptor-added genomic DNAs are amplified by using
CC an adaptor primer having the common sequence to the different adaptor and
CC a sequence-specific adaptor; and (j) the ratios of the amplified amounts
CC of the genomic DNAs are measured between the individuals. The method is
CC used for the detection of the amounts of RNA and DNA. The present
CC sequence represents an oligonucleotide which is used in the
CC exemplification of the present invention

XX
XX The present invention relates to a new oligonucleoside which comprises
CC alternating first and second segments. The first segment comprises at
CC least one sugar modified nucleoside. The second segment comprises at
CC least one 2'-deoxynucleoside. The oligonucleoside comprises at least 2 of
CC each of the first and second segments, so that it comprises at least 4
CC alternating segments. The oligonucleotide is useful for preparing a
CC composition for inducing RNase H-mediated cleavage of a target RNA in a
CC system, preventing or decreasing translation, transcription or
CC replication of a target RNA in a system, detecting the presence of a
CC target RNA in a system, validating a gene target corresponding to a
CC target RNA in a system or preventing or treating a disease related to a
CC target RNA in a system, e.g., acquired immune deficiency syndrome (AIDS)
CC or hepatitis B. The invention is useful in gene therapy. The present
CC sequence is an antisense DNA-RNA hybrid used in the exemplification of
CC the invention

 PT Concurrent interrogation of a number of polymorphic sites, useful for
 PT genetic testing, carrier screening, genetic profiling, and identity
 PT testing, comprises conducting a multiplexed elongation assay using
 PT probes.
 XX
 XX Example 9; Page 46; 143pp; English.
 PS
 XX This invention relates to a novel method for the concurrent interrogation
 CC of a number of polymorphic sites in the presence of, and without
 CC interference from, non-designated polymorphic sites. Specifically, it
 CC comprises conducting a multiplexed elongation assay by applying one or
 CC more temperature cycles to achieve linear amplification of the target or
 CC a combination of annealing and elongation steps under temperature-
 CC controlled conditions. Furthermore, this detection method uses probe
 CC extension or elongation and relies on enzymatic recognition, a superior
 CC technique that no longer depends on differential hybridisation. The
 CC present invention describes probes and methods useful for identifying or
 CC detecting polymorphisms at one or more designated sites, such that they
 CC can identify mutations within the cystic fibrosis conductance
 CC transmembrane regulator (CFTR) or the human leukocyte antigen (HLA)
 CC genes. In addition, concurrent interrogation of a multiplicity of
 CC polymorphic sites is useful for genetic testing, carrier screening,
 CC genotyping or genetic profiling, and identity testing. This
 CC oligonucleotide is the negative control probe used for the elongation
 CC mediated multiplexed analysis of HLA-DR, in an exemplification of the
 CC invention.

 PT Amplifying for RNA in a sample, useful for improving RNA polymerase based

PT RNA transcription from a polynucleotide template, comprises eliminating
 PT single-stranded oligonucleotide from the transcription sample.
 XX
 XX Example 1; SEQ ID NO 8; 26pp; English.
 PS
 XX The invention relates to amplifying for RNA in a sample comprises
 CC eliminating single-stranded oligonucleotide from the transcription
 CC sample. The method involves synthesizing single-stranded cDNA by
 CC incubating the sample RNA with reverse transcriptase and an
 CC oligonucleotide primer that primes synthesis in a direction toward 5' end
 CC of the RNA; converting the single-stranded cDNA into double-stranded cDNA
 CC to form a transcription sample containing a cDNA template; eliminating
 CC single-stranded oligonucleotide from the transcription sample; and
 CC transcribing the cDNA template into RNA using an RNA polymerase. The
 CC method is useful for improving RNA polymerase based RNA transcription
 CC from a polynucleotide template. The method inhibits the undesired non-
 CC template derived production of RNA in the transcription reaction.
 CC Sequences ADI34483-ADI34489 represent oligonucleotides used in a T7 RNA
 CC transcription reaction.

 PT Determining a functional property of fluid in chamber by introducing a
 PT support comprising test elements having reaction and detection domains,
 PT introducing a test fluid, and detecting locations not reactive with the
 PT fluid.
 XX
 PS Example 2; SEQ ID NO 2; 22pp; English.
 XX
 CC The invention relates to a method of determining a functional property of
 CC a fluid in a chamber comprising introducing into the chamber a support to
 CC which is bound several test elements, each of the test elements
 CC comprising a reaction domain and a detection domain, introducing into the

CC chamber a fluid that is interactive with the reaction domains, removing
CC the fluid from the chamber, determining by means of the detection domains
CC the locations at which the fluid has not interacted with the reaction
CC domains, and relating the locations to the functional property of the
CC fluid. The reaction domains involves nucleotides. The detection domain
CC comprises a member of a specific binding pair. The determining of the
CC step involves treating the test elements to modify only those reaction
CC domains that have interacted with the fluid. The functional property is
CC chosen from the flow pattern of the fluid, reagent distribution within
CC the fluid and time dependent reactivity of the fluid. The method is
CC useful for determining a functional property of a fluid in a chamber and
CC for synthesising arrays of biopolymers e.g., arrays of polynucleotides.
CC The method provides for the characterisation of a new fluid in a known
CC flow cell, a known fluid in a new flow cell or a new fluid/flow cell
CC combination. This sequence represents a test element used in the method
CC of the invention.

PT Synthesizing single stranded cDNA, involves annealing cDNA synthesis
PT primer to RNA and synthesizing first cDNA strand, ligating adaptor to
PT single stranded cDNA using DNA ligase, and amplifying ligated single
PT stranded cDNA fragment.

XX

PS Example 1; SEQ ID NO 6; 22pp; English.

XX

CC The invention describes a method of synthesising single stranded cDNA by
CC a 5'-ligated adaptor-mediated process involving: annealing a cDNA
CC synthesis primer to RNA, separating the cDNA strand from the RNA,
CC purifying the cDNA, contacting the cDNA with an adaptor, ligating the
CC adaptor through 5'-phosphate on strand (II) of the adaptor to single
CC stranded using DNA ligase, and amplifying the obtained ligated single
CC stranded fragment in an molecular amplification procedure. The method is
CC useful for: synthesising a single stranded cDNA by a 5'-ligated adaptor-
CC mediated process, where the source of nucleic acid is chosen from blood,

CC serum, plasma, cerebrospinal fluid, urine, tissue samples, biopsies and
CC saliva. The tissue sample comprises a cell population which may be single
CC cell, 100-100000 cells or more as desired; making a cDNA library from a
CC collection of mRNA molecules in a sample, where the method is applied to
CC amplify the cDNAs corresponding to the mRNAs by annealing one or more
CC cDNA synthesis primers to several mRNAs in the sample; producing a
CC subtractive hybridisation probe which involves synthesising a double-
CC stranded cDNA collection from a first mRNA population by the method,
CC where primer 1 is modified by biotin in the 5' end, isolating the biotin-
CC containing single stranded cDNA (sense) by use of streptavidin coated
CC magnetic beads, synthesising a double-stranded cDNA collection from a
CC second mRNA population according to the method, isolating the non-biotin-
CC containing single stranded cDNA (anti-sense) by use of streptavidin
CC coated magnetic beads, hybridising the sense to the anti-sense cDNA,
CC where an unhybridised sub-population of the anti-sense cDNA is found,
CC isolating the unhybridised sub-population of the antisense cDNA by use of
CC streptavidin coated cDNA, and generating a second double-stranded cDNA
CC collection from the unhybridised sub-population by PCR using primer 1 and
CC primer 2; and detecting expression of a gene in a pre-selected cell
CC population. The method is an improved method for producing amplified
CC heterogeneous populations of cDNA from limited quantities of RNA or other
CC nucleic acid. This sequence represents a poly-A-tail used to in the
CC production single stranded cDNA.

CC isolating the unhybridised sub-population of the antisense cDNA by use of
CC streptavidin coated cDNA, and generating a second double-stranded cDNA
CC collection from the unhybridised sub-population by PCR using primer 1 and
CC primer 2; and detecting expression of a gene in a pre-selected cell
CC population. The method is an improved method for producing amplified
CC heterogeneous populations of cDNA from limited quantities of RNA or other
CC nucleic acid. This sequence represents the complement of a poly-A-tail
CC used to in the production single stranded cDNA.

PT Constructing synthetic polynucleotide for modulating the quality of a
PT selected phenotype displayed by an organism comprises replacing a first

PT codon with a synonymous codon to construct the synthetic polynucleotide.
XX
PS Example 1; SEQ ID NO 77; 86pp; English.
XX

CC The present invention describes a method for constructing a synthetic
CC polynucleotide from which a polypeptide is producible to confer a
CC selected phenotype to an organism of interest or part in a different
CC quality than that conferred by a parent polynucleotide that encodes the
CC same polypeptide. The method comprises: (a) selecting a first codon of
CC the parent polynucleotide for replacement with a synonymous codon, where
CC the synonymous codon is selected on the basis that it exhibits a
CC different phenotypic preference than the first codon in a comparison of
CC phenotypic preferences in test organisms or parts, where the test
CC organism are selected from organisms of the same species as the organism
CC of interest and organisms that are related to the organisms of interest;
CC and (b) replacing the first codon with the synonymous codon to construct
CC the synthetic polynucleotide. Also described: (1) a method for
CC determining the phenotypic preference of a first codon in an organism of
CC interest or its parts; (2) a synthetic polynucleotide constructed from
CC the method above; (3) an organism of interest or part containing a
CC synthetic polynucleotide constructed from the method above; (4) an
CC organism of interest or part containing a synthetic construct that
CC comprises a regulatory polynucleotide operably linked to a tandem repeat
CC of a first codon fused in frame with a reporter polynucleotide that
CC encodes a reporter protein, which produces, or is predicted to produce a
CC selected phenotype or a phenotype of the same class as the selected
CC phenotype in the organism or part; (5) a method of modulating the quality
CC of a selected phenotype that is displayed by an organism of interest or
CC part and that results from the expression of a parent polynucleotide that
CC encodes the polypeptide; (6) a method of enhancing the quality of a
CC selected phenotype that is displayed by an organism of interest or part
CC and that results from the expression of a parent polynucleotide that
CC encodes the polypeptide; and (7) a method of reducing the quality of a
CC selected phenotype that is displayed by an organism of interest or part
CC and that results from the expression of a parent polynucleotide that
CC encodes the polypeptide. The method is useful for constructing a
CC synthetic polynucleotide from which a polypeptide is producible to confer
CC a selected phenotype to an organism of interest or part in a different
CC quality than that conferred by a parent polynucleotide that encodes the
CC same polypeptide. It is useful for modulating the quality of a selected
CC phenotype displayed by an organism or part. The present sequence encodes
CC a synthetic leader sequence, which is used in an example from the present
XX invention.

 PT Signal amplification method for detecting expressed gene, by using
 PT reverse transcription reaction and self-assembly reaction of
 PT oligonucleotide probes.
 XX
 PS Disclosure; SEQ ID NO 4; 27pp; Japanese.
 XX
 CC The invention relates to a signal amplification method (M1) for detecting
 CC expressed gene using reverse transcription reaction and a self-assembly
 CC reaction of forming a self assembly of oligonucleotide probes, thus
 CC improving detection sensitivity of the expressed gene in a DNA chip. (M1)
 CC is useful for signal amplification method (M1) for detecting expressed
 CC gene (claimed). (M1) improves detection sensitivity of the expressed gene
 CC in a DNA chip (claimed). (M1) does not require use of expensive enzymes
 CC and enables detection corresponding to the original RNA length or
 CC expression amount because of using neither linear amplification nor PCR.
 CC This sequence corresponds to a nucleotide used in the method of the
 CC invention.

PT Identifying and detecting nucleic acids, particularly DNA hybridization
PT probes, involves employing chain extending enzymes (e.g. telomerase) to
PT elongate probes to render them readily detectable.
XX
PS Example 1; Page 5; 10pp; English.
XX
CC The present invention describes a method for detecting a nucleic acid
CC probe, which comprises using chain extending enzymes to elongate probes.
CC The method comprises: (a) treating the sample with a chain terminating
CC reagent to prevent polynucleotide chain growth from the nucleic acid in
CC the sample; (b) contacting the sample with the probe containing a
CC terminus capable of elongation by a chain extending enzyme, where the
CC probe hybridises to the nucleic acid in the sample; (c) contacting the
CC sample with a chain extending enzyme and its substrates, which elongates
CC the probe; and (d) detecting the elongated hybridised probe. Also
CC described is a method comprising: (a) treating nucleic acid molecules or
CC modified nucleic acids in a sample with a reagent or reagents that render
CC the nucleic acid chains unextendable by a non-template-dependent enzyme;
CC (b) hybridising the treated molecules with a nucleic acid probe that
CC includes an extendable terminus, under conditions where hybrids form; and
CC (c) treating any hybrids formed with a non-template dependent chain
CC elongating enzyme and its substrates, where any hybridised probe is
CC extended. The method is useful for identifying and detecting nucleic
CC acids, particularly DNA hybridisation probes. The present sequence
CC represents a tailing reaction exemplary primer, which is used in an
CC example from the present invention

XX

PT New oligonucleotide comprising at least one 2',5'-internucleotide linkage

PT useful for treating organisms having disease caused by undesired

PT production of protein e.g. bacteria, yeast, protozoa and algae.

XX

PS Example 54; SEQ ID NO 7; 30pp; English.

XX

CC The invention describes an oligonucleotide comprising several nucleotides

CC covalently linked together by internucleotide linkages. At least one of

CC the nucleotides is linked to an adjacent nucleotide by 2',5'-

CC internucleotide linkage and bears a 3'-substituent. The oligonucleotides

CC are useful: as antisense oligonucleotides; in pharmaceutical compositions

CC ; for treating organisms having disease caused by undesired production of

CC protein e.g. organism that utilises RNA-DNA transcription or RNA-protein

CC translation, bacteria, yeast, protozoa, algae and warm-blooded animals;

CC for developing diagnostic and therapeutic agents. The modified

CC oligonucleotide exhibits improved properties of nuclease resistance and

CC binding affinity. The oligonucleotides are easy to synthesise and exhibit

CC good properties of nuclease resistance and hybridisation to target

CC nucleic acids. The oligonucleotide is potent antisense agent with longer

CC duration of action. This sequence represents an oligonucleotide of the

CC invention.

XX DT An isolated nucleic acid molecule, comprising nucleic acid sequence of
XX PT Nicotiana derived cytochrome P450 enzyme fragments, useful for producing
XX PT transgenic plants.
XX PS Disclosure; Fig 73; 82pp; English.
XX CC The invention relates to an isolated nucleic acid molecule (I),
XX CC comprising a nucleic acid sequence chosen from 75 Nicotiana-derived
XX CC cytochrome P450 enzyme fragment sequences. (I) is useful for producing a
XX CC transgenic tobacco plant, which involves operably linking (I) with a
XX CC promoter functional in the plant to create a plant transformation vector,
XX CC and transforming the plant with the plant transformation vector,
XX CC selecting a plant cell transformed with the transformation vector, and
XX CC regenerating a plant from the selected plant cell. The nucleic acid
XX CC molecule is in an antisense orientation, sense orientation or is in a RNA
XX CC interference orientation. The present sequence represents a PCR primer
XX CC used to clone DNA encoding tobacco cytochrome P450 enzyme fragments of
XX CC the invention.

XX New stem cell factor polypeptide(s) - for stimulating the growth of

PT primitive progenitor cells, esp. for treating disorders involving blood

PT cells.

XX Example 3; Fig 12C; 127pp; English.

PS AAT04915-T04922 are oligonucleotide primers and probes used for the

XX amplification and sequencing of mammalian stem cell factor (SCF). Non-

CC naturally occurring SCF and C-terminally truncated polypeptides, having

CC amino acid sequences sufficiently duplicative of naturally occurring SCF,

CC stimulate growth of primitive progenitors such as haematopoietic

CC progenitor cells, neural stem cells and primordial germ stem cells. The

CC peptides can be used in a composition for treating leucopenia, anaemia or

CC thrombocytopenia, for enhancing engraftment of bone marrow during

CC transplantation or for bone marrow recovery after chemotherapy or

CC radiation-induced bone marrow aplasia or myelosuppression. They can also

CC be used for treating neoplasia, nerve damage, infertility, intestinal

CC damage or myeloproliferative disorders. Antibodies may be raised against

CC the peptides for use in detection or neutralisation of SCF in serum. SCF

CC may be useful for the treatment of AIDS and severe combined

CC immunodeficiency (SCID) states alone or in combination with other factors

CC such as IL-7. (Updated on 25-MAR-2003 to correct PF field.)

XX
PT Production of hematopoietic cells suitable for administration to a
PT subject using progenitor cells and expanding the cells using stem cell
PT factor.
XX
PS Example 3; Fig 12C; 123pp; English.
XX
CC A method has been developed of making haematopoietic cells suitable for
CC administration to a subject. The method comprises: (a) obtaining
CC haematopoietic progenitor cells from a donor; and (b) expanding the cells
CC by adding to the cells a haematopoietically effective dose of a
CC polypeptide product having at least part of the primary structural
CC confirmation and one or more of the biological properties of naturally
CC occurring stem cell factor (SCF). The method is useful for stimulating
CC primitive progenitor cells including early haematopoietic progenitor
CC cells which are capable of maturing to erythroid, megakaryocyte,
CC granulocyte, lymphocyte and macrophage cells. SCF results in absolute
CC increases in haematopoietic cells of both myeloid and lymphoid lineages.
CC SCF is useful for treating haematopoietic disorders. The method is useful
CC for expanding early haematopoietic progenitors in syngeneic, allogeneic
CC or autologous bone marrow transplant. SCF is useful for enhancing the
CC efficiency of gene therapy based on transfecting haematopoietic stem
CC cells. SCF is also useful for combating the myelosuppressive effects of
CC anti-HIV drugs such as AZT and for enhancing haematopoietic recovery
CC after acute blood loss and as a boost to the immune system for fighting
CC neoplasia (cancer). The present sequence represents a universal
CC oligonucleotide which is used in an example from the present invention

XX Composition for treating hormone-regulated cancer, e.g. breast and
PT prostatic tumors, comprising an antisense oligonucleotide that inhibits
PT expression of insulin like growth factor binding protein-5 by hormone-
PT regulated tumor cells.
XX
PS Disclosure; Page 34; 45pp; English.
XX
CC This sequence represents an antisense oligonucleotide targeted against
CC human insulin-like growth factor binding protein-5 (IGFBP-5). The
CC invention relates to a composition for treatment of hormone-regulated
CC cancer, comprising an antisense oligonucleotide (such as this sequence)
CC which inhibits expression of IGFBP-5 by hormone-regulated tumour cells.
CC The compositions is useful for delaying progression of hormone-regulated
CC tumour cells such as prostatic cancer cells or breast cancer cells, to an
CC androgen-independent state, by treating hormone sensitive tumour cells
CC with the antisense sequence which inhibits expression of IGFBP-5 by the
CC tumour cells. The composition can also be used for treating a hormone-
CC responsive cancer in an individual, and administering the composition to
CC the individual after initiation of hormone-withdrawal to induce apoptotic
CC cell death of hormone-responsive tumour cells, and therefore delaying the
CC progression of hormone-responsive cancer cells to a hormone-independent
CC state in the individual. It can also be used for inhibiting or delaying
CC metastatic bone progression of an IGF-1 sensitive tumour in a mammal, by
CC administering the composition to inhibit the expression of IGFBP-5 by the
CC hormone-responsive cancer cells, and therefore inhibiting or delaying
CC metastatic bone progression of the tumour

PT Enhancing efficiency of transfer of polynucleotide into a target
PT mammalian cell in vitro, involves exposing cell that expresses a stem
PT cell factor receptor to stem cell factor, and introducing polynucleotide
PT into cell in vitro.
XX
PS Example 3; Fig 12C; 210pp; English.
XX
CC The present invention describes a method for enhancing (E) the efficiency
CC of transfer of a polynucleotide (I) into a target mammalian cell (II) in
CC vitro, comprising exposing (II) that expresses a stem cell factor (SCF)
CC receptor to a biologically active SCF, its analogue or fragment, which
CC induces cell proliferation, and introducing (I) to (II) in vitro.
CC Exposure of SCF to (II) results in increased uptake of (I) into the cell.
CC The method is useful for enhancing the efficiency of the transfer of a
CC polynucleotide into a target mammalian cell in vitro. The method is
CC useful in gene therapy techniques. AAH41301 to AAH41364 and AAB98351 to
CC AAB98390 represent sequences used in the exemplification of the present
CC invention

 PT Novel non-naturally-occurring stem cell factor polypeptide, useful for
 PT treating leucopenia, thrombocytopenia, anemia and for enhancing
 PT engraftment of bone marrow during transplantation in a mammal.
 XX
 PS Example 3; Fig 12C; 217pp; English.
 XX
 CC The present invention relates to novel non-naturally-occurring stem cell
 CC factor (SCF) polypeptides having an amino acid sequence sufficiently
 CC duplicative of that of naturally-occurring SCF to allow possession of
 CC haematopoietic biological activity of naturally occurring SCF. Sequences
 CC of the invention are useful for treating leucopaenia, thrombocytopenia,
 CC anaemia and for enhancing bone marrow recovery in treatment of radiation,
 CC engraftment of bone marrow during transplantation in mammals and chemical
 CC or chemotherapeutic induced bone marrow aplasia or myelosuppression. They
 CC are also useful for treating acquired immune deficiency in a human, nerve
 CC damage, neoplasia, infertility, myeloproliferative disorder, intestinal
 CC damage in a mammal. SCF sequences are useful for preparing biologically
 CC active polymer polypeptide adduct, for enhancing transfection of early
 CC haematopoietic progenitor cells with a gene, and transfer of a gene into
 CC a mammal. They are useful for treating myelofibrosis, myelosclerosis,
 CC osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma,
 CC Hodgkin's disease, lymphoma, Gaucher's disease, Niemann-Pick disease,
 CC Letterer-Siwe disease, refractory erythroblastic anaemia, Di Guglielmo
 CC syndrome, congestive splenomegaly, Kala azar, sarcoidosis, primary
 CC splenic pancytopenia, disseminated fungus disease, malaria, military
 CC tuberculosis, Fulminating septicaemia, pyridoxine deficiency, vitamin B12
 CC and folic acid deficiency, Diamond Blackfan anaemia, hypopigmentation
 CC disorders such as piebaldism, AIDS (acquired immune deficiency syndrome)
 CC and vitiligo. The present sequence is a PCR primer which is used for
 CC amplifying the 5' end of rat SCF cDNA. This sequence is used in the
 CC exemplification of the invention

PT New non-natural stem cell factor, useful for treating e.g. leucopenia or
PT immune deficiency, also related nucleic acid and antibodies.
XX
PS Disclosure; SEQ ID NO 32; 217pp; English.
XX
CC The invention relates to stem cell factor (SCF) polypeptides with
CC haematopoietic activity and the polynucleotides encoding them. The
CC polypeptides are used for treating infertility, intestinal damage,
CC myeloproliferative disorders, leucopenia, thrombocytopenia or anaemia,
CC for improving engraftment of bone marrow transplants, for enhancing bone
CC marrow recovery after radiotherapy or chemotherapy and in treatment of
CC immune deficiency, neoplasia, nerve damage, osteoporosis, metastatic
CC carcinoma, leukaemia and military tuberculosis. The SCF polypeptides are
CC also used to expand haematopoietic progenitor cells for transplantation
CC and to prepare such cells for transfection with a gene. The SCF
CC polynucleotides can be used for recombination expression of the
CC polypeptides and also as probes for mapping of the SCF gene, for
CC identifying SCF-related diseases and as a marker for neighbouring genes.
CC Antibodies raised against the polypeptides are useful in diagnosis and to
CC remove SCF from blood. This sequence represents SCF related DNA of the
XX invention.

XX
PS Claim 15; SEQ ID NO 4961; 763pp; English.
XX
CC This invention describes a novel composition (a) a first active agent,
CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

PT Preparing a human stem cell factor (SCF) polypeptide, useful for treating

PT hematopoietic disorders, e.g., aplastic anemia, comprises growing host

PT cells transformed or transfected with DNA encoding a human SCF.

PS Example 3; SEQ ID NO 32; 210pp; English.

XX The invention relates to preparing a (vertebrate) human stem cell factor

CC (SCF) polypeptide comprising growing host cells transformed or

CC transfected with DNA encoding a human SCF that stimulates growth of

CC haematopoietic progenitor cells under nutrient conditions, the DNA being

CC operatively linked to an expression control sequence, and isolating the

CC polypeptide produced. Also included is a recombinant host cell

CC transformed or transfected with an expression construct comprising a

CC vertebrate SCF polypeptide-encoding DNA operatively linked to a

CC heterologous expression regulatory sequence, permitting the expression of

CC the vertebrate SCF polypeptide in the host cell. Disclosed as new are rat

CC and human nucleic acids encoding SCF, SCF proteins from a number of other

CC mammals and recombinantly expressed SCF protein fragments. The DNA

CC sequences are useful for effecting the large scale synthesis of SCF by a

CC variety of recombinant techniques or for generating new and useful viral

CC and circular plasmid DNA vectors, new and useful transformed and

CC transfected prokaryotic and eukaryotic host cells, and new and useful

CC methods for cultured growth of such host cells capable of expression of

CC SCF and its related products. The DNA sequences are also useful as

CC labelled probes in isolating human genomic DNA encoding SCF, in methods

CC of protein synthesis, in genetic therapy in humans and other mammals, and

CC in developing transgenic mammalian species which may serve as eukaryotic

CC hosts for production of SCF and SCF products in quantity. The SCF is

CC useful for treating haematopoietic disorders, e.g., aplastic anaemia,

CC paroxysmal nocturnal haemoglobinuria, myelofibrosis, myelocleorosis,

CC osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma,

CC Hodgkin's disease, lymphoma, Gaucher's disease, Niemann-Pick disease,

CC Letterer-Siwe disease, refractory erythroblastic anaemia, Di Guglielmo

CC syndrome, congestive splenomegaly, Kala awar, sarcoidosis, primary

CC splenic pancytopenia, miliary tuberculosis, disseminated fungus disease,

CC Fulminating septicaemia, malaria, vitamin B 12 and folic acid deficiency,

CC pyridoxine deficiency, Diamond Blackfan anaemia, and hypopigmentation

CC disorders such as piebaldism and vitiligo. The SCF are also useful for

CC treating neurological damage, infertility states, intestinal damage

CC resulting from irradiation or chemotherapy, and AIDS. SCF is also useful

CC for enhancing haematopoietic recovery after acute blood loss and as a

CC boost to the immune system for fighting neoplasia (cancer). The present

CC sequence is a universal SCF PCR primer used in the isolation of SCF DNA.

CC A method for the analysis of cDNA comprises (a) preparing an aggregate of
CC double-stranded cDNAs by using an aggregate of mRNAs and a plural type of
CC labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)
CC and using the aggregate of mRNAs as the template for each reverse
CC transcription primer; (b) digesting each of the prepared aggregates of
CC the double-stranded cDNAs with restriction enzyme and; (c)
CC electrophoresing the digested aggregate of cDNAs in separate lanes. The
CC method can be used to analyse gene expression rapidly and easily

PT Sorting single-stranded nucleic acid, useful for analyzing expression
PT patterns and screening active agents, uses capture agent with variable
PT and constant regions.
XX
PS Example; Page 5; 8pp; German.
XX This invention describes a novel method for sorting single-stranded
CC nucleic acids by isolation and hybridisation of nucleic acid pools, then
CC reading out, where the nucleic acids are selectively bound using capture
CC agents that are (a) immobilised on the surface of a solid matrix and (b)
CC comprise variable and non-variable regions. The capture oligonucleotides
CC have a 5'-invariable anchor region, the complement of which is present at
CC least once in each nucleic acid and a 3'-variable, discriminatory region
CC that comprises all possible combinations of up to 10 nucleotides to allow

CC binding of particular sorts of single stranded nucleic acids. The capture
CC agents are particularly locked nucleic acids (LNA) and the anchor region
CC comprises a sequence of 10-50, particularly 15-25, T residues. The
CC capture oligonucleotides are biotinylated and immobilised on a surface by
CC interaction with streptavidin. The matrix is of plastic, ceramic, glass,
CC metal, resin, gel, crystalline material and/or membrane, having semi-
CC conducting properties and especially in the form of a chip. Its surface
CC is particularly a layer of (bio)molecular filaments and binding of single
CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular,
CC physical, stimulated by an electrical field or through a molecular sieve.
CC The method is used (i) for analysis of patterns, especially in mucosal,
CC hair root, blood, nerve or germ cells and (ii) for determining the
CC activity of pharmaceuticals and/or nutritional compounds, e.g. food
CC additives or supplements, especially minerals, trace elements, organic
CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and
CC mixtures. The method provides rapid, inexpensive and reproducible
CC representation of differences in pools of nucleic acids from cells. It
CC allows imaging of the complete pattern of all nucleic acid in a cell, and
CC can detect very small differences in the nucleic acid pool. Since the
CC method is based on comparison of nucleic acid pools, not individual
CC genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent
CC capture probes used in the method of the invention.

PT

XX PS Claim 1; Page 4; 14pp; German.

CC This invention describes a novel method of determining a predisposition

CC to disease by genotyping a subject's DNA sequence (A) of the human

CC mismatch repair gene, MSH6 at specified positions and comparing with

CC reference DNA sequences, optionally taking into account all possible

CC combinations of variations of the individual mutations, including any

CC chosen absolute number of variations. (A), and analysis of their

CC sequences, are useful for the following: (i) determining a predisposition

CC to disease, especially colorectal, endometrial and ovarian carcinoma and

CC leukemia; (ii) determining an increased mutation rate (frequency of base

CC substitutions, insertions and/or deletions) in eukaryotic cells; (iii)

CC predicting the progression, severity and survival time of patients with

CC neoplastic disease; (iv) the development of therapeutic and 'life-style'

CC drugs; (v) predicting individual differences in response to known

CC chemotherapeutic agents (e.g. cis-platin) or drugs developed from (iv);

CC (vi) optimizing individual treatments and interventions against neoplasia

CC ; (vii) controlling the mutation rate in eukaryotic cells, in vitro or in

CC vivo; (viii) constructing genes and vectors, particularly for development

CC of pharmaceuticals; (ix) developing diagnostic kits and other systems for

CC genotyping; and (x) developing in vivo and in vitro test systems for

CC expressing individual forms of the MSH6 gene, e.g. for studying

CC pathophysiology of disease or processes in which MSH6 is involved, and

CC for drug development and testing

XX

CC The present sequence is a telomerase Oligo-dT-Primer, which can be used

CC in a novel method for detecting telomerase activity. The method comprises

CC adding to a test sample a 1st primer, that serves as telomerase

CC substrate, and nucleoside triphosphate (dNTP) and incubating to allow

CC primer extension by the telomerase, amplifying the extension product,

CC immobilising the amplification product (AP) on a solid phase and

CC qualitative and/or quantitative detection of AP, where the substrate

CC primer is preferably from the 5'-region of the long terminal repeat 2

CC (LTR-2) sequence of a retrovirus. The method can be used to diagnose

CC tumours and screen compounds for effector activity. Immobilisation of AP

CC provides a signal that is reproducibly representative of telomerase

CC activity, eliminates the need for gel electrophoretic separation and

CC provides high sensitivity. Radioactive labels are not required and the

CC method can be automated for routine use. Specific detection is achieved

CC by proper choice of hybridisation conditions, without separation of the

CC telomerase extension product. A specific signal is generated by 1-10 cell

CC equivalents, but for tumour analysis 10-1000 ng of tissue is usually used

DR Analysis of cDNA and gene expression - by amplification of mRNA followed

PT by digestion with restriction enzymes.

XX Disclosure; Page 5; 11pp; Japanese.

PS A method for the analysis of cDNA comprises (a) preparing an aggregate of

CC double-stranded cDNAs by using an aggregate of mRNAs and a plural type of

CC labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)

CC and using the aggregate of mRNAs as the template for each reverse

CC transcription primer; (b) digesting each of the prepared aggregates of

CC the double-stranded cDNAs with restriction enzyme and; (c)

CC electrophoresing the digested aggregate of cDNAs in separate lanes. The

CC method can be used to analyse gene expression rapidly and easily

PS
XX
CC This invention describes a novel method for identifying an inhibitor
CC potentially useful for treatment of cancer, where the inhibitor is active
CC on a gene vital for cell growth or viability, and where the gene is
CC subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is
CC used for preventing the development of cancer in a patient having a
CC precancerous condition, by administering to the patient a first allele
CC specific inhibitor (ASI) targeted to an allele of a first essential gene
CC present in cells of the precancerous condition, where the normal somatic
CC cells of the patient are heterozygous for the first gene, the inhibitor
CC is active on at least one but less than all allelic forms of the gene
CC present in a population and targets only one allelic form present in the
CC normal somatic cells, and the first gene. The products and methods can be
CC used in the diagnosis, prevention and treatment of LOH disorders, e.g.
CC cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic
CC lesions, benign tumours, endometriosis, polycystic kidney disease, and
CC graft versus host disease. The method can also be used to remove
CC malignant cells from bone marrow transplants. AA225812-226825 represent

PT New modified antisense oligonucleotide, useful particularly for treating
PT prostatic cancer, inhibits the testosterone-repressed prostate message-2.
XX
PS Example 13; Page 20; 44pp; English.
XX
XX
CC The invention relates to a compound consisting of an oligonucleotide with
CC a phosphorothioate backbone throughout, in which: (a) sugars on
CC nucleotide residues 1-4 and 18-21 are 2'-O-methoxyethyl modified, and the
CC remaining nucleotides 5-17 are 2'-deoxy; and (b) the cytosines at
CC positions 1, 4 and 19 are 5-methylated. Oligonucleotide shown in sequence
CC ACF36398 (I) is used: (a) to delay progression of androgen-sensitive
CC prostatic cancer cells to the androgen-independent state, in vivo or in
CC vitro; (b) to treat prostatic cancer (after initially withdrawing
CC androgens to induce apoptosis); and (c) to increase sensitivity of cancer
CC cells (prostatic, renal, non-small cell lung, urothelial transitional,
CC ovarian and some breast cancer cells) that express abnormal levels of
CC TRPM-2 to chemotherapy or radiation. The modifications present in (I)
CC increase stability in vivo and activity (both in vivo or in vitro) and
CC result in a synergistic increase in effect when (I) is used with
CC chemotherapeutic agents or other antisense oligonucleotides directed
CC against other antiapoptotic genes. The present sequence represents a
CC mismatch control oigonucleotide, used in antisense assays of anti-
CC apoptotic protein TRPM-2 (testosterone-repressed prostate message-2)

PT Enhancing the chemo-sensitivity or radiation-sensitivity of cancer cells
PT that expresses testosterone-repressed prostate message-2 (TRPM-2)
PT comprises administering a composition that inhibits expression of TRPM-2.
XX
PS Disclosure; SEQ ID NO 15; 14pp; English.
XX
CC The present invention provides a method for treating cancer in which
CC cancer cells express testosterone-repressed prostate message-2 (TRPM-2).
CC The invention is useful for enhancing the chemo-sensitivity or radiation-
CC sensitivity of cancer cells for treating cancer such as prostate cancer,
CC bladder cancer, ovarian cancer, lung cancer and renal cell carcinoma
CC (RCC). The invention is also useful in antisense gene therapy. The
CC present sequence is control testosterone-repressed prostate message-2
CC (TRPM-2) mismatch oligonucleotide. The oligonucleotide is used in the
CC exemplification of the invention.

PT Analysis of cDNA and gene expression - by amplification of mRNA followed
PT by digestion with restriction enzymes.
XX
PS Disclosure; Page 5; 11pp; Japanese.
XX
CC A method for the analysis of cDNA comprises (a) preparing an aggregate of
CC double-stranded cDNAs by using an aggregate of mRNAs and a plural type of
CC labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)
CC and using the aggregate of mRNAs as the template for each reverse
CC transcription primer; (b) digesting each of the prepared aggregates of
CC the double-stranded cDNAs with restriction enzyme and; (c)
CC electrophoresing the digested aggregate of cDNAs in separate lanes. The
CC method can be used to analyse gene expression rapidly and easily

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 4180; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

XX
PT Pharmaceutical composition for treating asthma, has antisense
PT oligonucleotide containing less percentage of adenosine, targeted to
PT nucleic acids associated with lung airway or lung dysfunction, and
PT bronchodilating agent.
XX
PS Claim 15; SEQ ID NO 5114; 763pp; English.
XX
CC This invention describes a novel composition (a) a first active agent,
CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.

CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

PT Pharmaceutical composition for treating asthma, has antisense
PT oligonucleotide containing less percentage of adenosine, targeted to
PT nucleic acids associated with lung airway or lung dysfunction, and
PT bronchodilating agent.
XX
PS Claim 15; SEQ ID NO 4180; 763pp; English.
XX
CC This invention describes a novel composition (a) a first active agent,
CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a

CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

PT      New antisense compound targeted to a nucleic acid molecule encoding
PT      Nav1.3, useful for treating a disease or condition associated
PT      with Nav1.3, e.g. pain, seizure disorder such as childhood seizure
PT      disorder, or ataxia.
XX
PS      Claim 4; SEQ ID NO 3800; 417pp; English.
XX
CC      The present invention relates to an antisense compound targeted to a
CC      nucleic acid molecule encoding Nav1.3, where the antisense compound
CC      specifically hybridizes with and inhibits the expression of Nav1.3. The
CC      compound and composition are useful for treating a disease or condition
CC      associated with Nav1.3, e.g. pain including but not limited to
CC      neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain,
CC      diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain,
CC      pain from burns, migraine headache, cluster headache, mild-to-moderate
CC      headache; seizure disorder such as childhood seizure disorder, including
CC      but not limited to neonatal or infantile epilepsy; or ataxia. The present
CC      sequence represents a chimeric phosphorothioate oligonucleotide with
CC      2'MOE wings and a deoxy gap. Used during the antisense inhibition of
CC      human Nav1.3 expression, the oligonucleotides are designed to target
CC      different regions of the human Nav1.3 RNA.

PT Analysis of cDNA and gene expression - by amplification of mRNA followed
PT by digestion with restriction enzymes.
XX
PS Disclosure; Page 7; 11pp; Japanese.
XX
CC A method for the analysis of cDNA comprises (a) preparing an aggregate of
CC double-stranded cDNAs by using an aggregate of mRNAs and a plural type of
CC labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)
CC and using the aggregate of mRNAs as the template for each reverse
CC transcription primer; (b) digesting each of the prepared aggregates of
CC the double-stranded cDNAs with restriction enzyme and; (c)
CC electrophoresing the digested aggregate of cDNAs in separate lanes. The
XX method can be used to analyse gene expression rapidly and easily

PT Identifying target genes for allele-specific drugs - used for diagnosis,
PT prevention and treatment of, e.g. cancers, atherosclerotic plaque,
XX dysplastic lesions, endometriosis or graft versus host disease.
PS Disclosure; Fig 7; 605pp; English.
XX

This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic form present in the normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z26825 represent human polymorphic sites described in the method of the invention

DE AA505075-derived oligonucleotide SEQ ID 4945.

Human; antisense; bronchoconstriction; allergy; hyposcretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

PS Claim 4; Page 79; 218pp; English.
XX
CC The present invention describes nucleic acid molecules which modulate the
CC synthesis, expression and/or stability of a mRNA encoding 1 or more
CC receptors of vascular endothelial growth factor (VEGF). A patient
CC (preferably human) having a condition associated with the level of the
CC fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing
CC receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour
CC angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be
CC treated by administering the nucleic acid molecule or the expression
CC vector to the patient. AAX67275 to AAX75752 represent specific examples
CC of nucleic acid molecules from the present invention

XX
PS Claim 77; Page 79; 148pp; English.
XX
CC The present invention describes nucleic acids (A) that interact stably
CC with a target sequence and contain at least one phosphoro(di)thioate
CC link, having endonuclease activity. (A), and more generally any catalytic
CC nucleic acid (A') that modulates expression of the oestrogen receptor
CC gene, are used to treat cancer (particularly of breast or endometrium),

CC in vivo or by transforming cells ex vivo and implanting treated cells, or
CC for other conditions associated with levels of oestrogen receptor.
CC Because of the high selectivity for targeted RNA, (A) can also be used to
CC correlate inhibition of gene expression with alterations in phenotype,
CC particularly for identification of therapeutic targets, and as research
CC reagents (for RNA, in the same way that restriction endonucleases are
CC used with DNA). The combination of modifications in (A) improves
CC resistance to nucleases, binding affinity and/or activity. AAA23503 to
CC AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and
CC AAA24748 to AAA25992 represent their corresponding target sequences.
CC AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme
CC sequences, and AAA26107 to AAA26218 represent their corresponding target
CC sequences. AAA26219 to AAA26271 represent other ribozyme sequences and
CC antisense oligonucleotides used in the exemplification of the present
CC invention

PT Retroviral expression vector, useful in gene therapy, contains a promoter
PT from a human endogenous retrovirus to provide cell-specific expression.
XX
PS Disclosure; Page 27; 67pp; German.
XX
CC This invention describes a novel retroviral expression vector (A)
CC containing DNA sequences (I) for packaging vector RNA and for cell-
CC specific expression of proteins or peptides encoding by heterologous DNA
CC (II). The sequences controlling cell-specific expression contain a cell-
CC specifically regulatable promoter region (P) from a human endogenous
CC retrovirus (HERV) DNA sequence. The invention also describes (a) mRNA and
CC RNA of (A); (b) prokaryotic and eukaryotic cells containing (A); (c)
CC eukaryotic cells containing (A) in integrated form; (d) virions
CC containing a retroviral expression vector RNA derived from (A); (e) a
CC method for producing the virions of (d); (f) a method for incorporating
CC protein-encoding nucleic acid sequences into a eukaryotic cell by

CC infection with the virions of (d); and (g) a retroviral vector system
CC containing (A) and a packaging cell line, that contains at least one
CC (recombinant) retrovirus construct that encodes for the packaging
CC proteins of (A). (A) are used for cell- or tissue-specific expression of
CC foreign genes for gene therapy and to produce virions for introducing
CC (II) into the chromosomal DNA of eukaryotic cells, preferably mammalian
CC and specifically human. (A) retain the advantages of usual retroviral
CC promoters with all the signal structures required for transcription in a
CC small region within the U3-R segment, but without their disadvantages
CC (excessive strength and limited cell specificity). Since (A) are derived
CC from endogenous (harmless) viral sequences, they do not introduce any new
CC viral sequences into the genome and recombination will not create new
CC types of retrovirus. The promoters provide cell or tissue specific
CC expression, according to which HERV they are derived from

PT Preparation of mixed backbone oligomeric compounds useful as e.g. primers
PT for diagnostic tests, involves oxidation of H-phosphonate internucleoside
PT linkages to phosphodiester internucleoside linkages.
XX
PS Example 12; Page 34; 49pp; English.
XX
CC The present sequence is that of a phosphorothioate oligonucleotide
CC containing 20 T nucleobases, each having a 2'-methoxyethoxy group on its
CC 5' ribosyl sugar moiety. It is an example of an oligomeric compound
CC produced according to the methods of the invention. The invention
CC provides compounds and methods for the preparation of mixed backbone

CC oligomeric, or chimeric, compounds having phosphodiester internucleoside
CC linkages in addition to phosphorothioate and/or phosphoramidate
CC internucleoside linkages. The methods also include incorporation of
CC boranophosphate internucleoside linkages. The methods utilize H-
CC phosphate intermediates that are coupled together forming contiguous
CC regions of 1 or more H-phosphonate internucleoside linkages. Each
CC contiguous region is subsequently oxidized to phosphodiester,
CC phosphorothioate, phosphoramidate or boranophosphate internucleoside
CC linkages prior to further elongation. Mixed backbone oligomeric compounds
CC are prepared in this manner by oxidizing adjacent regions with different
CC reagents. Oligomeric compounds of the invention are prepared using novel
CC oxidation steps that oxidize a region of 1 or more H-phosphonate
CC internucleoside linkages without degrading existing linkages that have
CC been previously oxidized. The oligonucleotides obtained are useful as
CC primers in PCR, probes, linkers, gene fragments and for other diagnostic
CC tests on e.g. biological tissue, fluid, cells etc., as research reagents,
CC and as antiviral agents

PT characteristic of sample mRNA population, analyzing patterns, comparing
PT gene expression by cell types under varied conditions, and identifying
PT genes.
XX
PS Disclosure; Fig 2; 67pp; English.
XX

CC The present invention relates to a method for providing a profile of mRNA
CC molecules present in a sample. The method comprises generating two
CC independent patterns characteristic of the population of mRNA molecules
CC expressed in the sample and analysing the patterns using a combinatorial
CC algorithm, comparing gene expression by different or same cell types
CC under different conditions, and identifying genes having a role in

CC various cellular processes. The method is useful for the analysis and
CC identification of transcribed genes, and fingerprinting. The method can
CC be used to identify genes which play a role in determining various
CC cellular processes, including susceptibility to external factors,
CC development, and disease. The present sequence for a PCR primer is used
CC in the production of a single pattern characteristic of a sample,
CC employing a Type IIS restriction enzyme (i.e. FokI) in the methods of the
CC present invention

PT New isolated nucleic acid, useful for treating viral diseases associated
PT with tumors and cell degeneration, also related polypeptides, antibodies
PT and transfected cells.
XX

PS Disclosure; Page 63; 720pp; French.

XX The invention relates to a novel isolated 17 mer nucleic acid sequence,
CC given in the specification, a sequence containing at least 15 consecutive
CC nucleotides from the 17 mer sequence, a sequence with, after optimal
CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that
CC hybridizes to them under highly stringent conditions, or the complement
CC of any of them, or the corresponding RNA. The novel isolated nucleic
CC acids of the invention are useful as probes and primers for detecting,
CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
CC component of a gene chip, in vitro as (anti)sense reagents, and for
CC production of recombinant polypeptides. Any of the nucleic acids,
CC polypeptides, vectors containing the nucleic acids, cells containing the
CC vector or antibodies directed against the polypeptides are useful for
CC preparation of pharmaceuticals for prevention and/or treatment of viral
CC diseases that are characterised by development of tumours or cell
CC degeneration, specifically cancer but also Alzheimer's disease and
CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in

CC patient samples is useful for diagnosis and/or prognosis of these
CC diseases. The polypeptides can also be used to generate antibodies, and
CC both the polypeptide and antibodies are useful as components of protein
CC chips. The nucleic acid sequences of the invention can be used in gene
CC therapy. This polynucleotide sequence represents a tumour suppression
CC related human fukutin oligonucleotide of the invention

PT New zinc finger-containing proteins and nucleic acids, useful in
PT manufacturing a medicament for treating or preventing a disorder
PT associated with decreased or increased expression or activity of MDZ3,
PT MDZ4, MDZ7 or MDZ12, e.g. cancer.
XX
PS Example 8; SEQ ID NO 5257; 103pp; English.
XX

CC The present invention relates to novel human zinc finger-containing
CC proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is
CC encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
CC MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC or in manufacturing a medicament for treating or preventing a disorder
CC associated with decreased or increased expression or activity of MDZ3,
CC MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC acids and proteins are also useful for diagnosing or monitoring a disease
CC caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC acids can also be used as probes to detect and characterize gross
CC alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC useful in constructing microarrays for measuring gene expression. The
CC proteins are useful as therapeutic agents for gene therapy or as
CC vaccines. The present sequence was used to illustrate the invention.

XX Novel acyclic linker-containing oligonucleotide useful for preventing or
decreasing translation, reverse transcription and/or replication of a
target RNA in a system, comprises a modified deoxyribonucleotide.
XX
XX Example 2; Fig 7; 104pp; English.
PS
XX The invention relates to an acyclic linker-containing oligonucleotide
comprising at least one modified deoxyribonucleotide. Oligonucleotides of
the invention are useful for preventing or decreasing translation,
reverse transcription and/or replication of a target RNA in a system.
They are useful for selectively preventing gene expression in a sequence-
specific manner, for hybridising to complementary RNA such as cellular
mRNA or viral RNA, to hybridise to and induce cleavage of complementary
RNA. They are also useful therapeutically in formulations or medicaments
to prevent or treat a disease characterised by the expression of a
particular target RNA. The invention is used in gene therapy. The present
sequence is an antisense oligo used to elicit human RNase (ribonuclease)
H degradation of target RNA. This sequence is used in the exemplification
of the invention

PT Determining polyadenylation sites within transcribed gene sequences
PT present in a sample comprises assigning to gene fragments gene candidates
PT within a database by comparing signals in the dataset with the database.
XX
PS Example; Fig 3; 8lpp; English.
XX
CC The invention relates to determining the presence of and/or identifying a
CC polyadenylation site within a sequence of a transcribed gene or variants
CC present in a sample. The method involves assigning to gene fragments gene
CC candidates within a database by comparing signals in the dataset with the
CC database, the database comprising data representing mRNAs with known
CC polyA sites and/or 'virtual genes', representing a possible
CC polyadenylation site within an actual gene. The method is useful for
CC determining the presence of and/or identifying a polyadenylation site or
CC alternative polyadenylation sites within a sequence of a transcribed gene
CC in a sample, in identifying gene variants present or potentially present
CC differences between sequence features, particularly in identifying
CC nucleic acid molecules, especially in identifying or discovering polyA
CC site usage or determining polyA site usage in a nucleic acid sample, and
CC gene variants arising from alternative polyA sites. The present sequence
CC represents a double stranded product DNA fragment

PT	New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.	CC	eliminating single-stranded oligonucleotide from the transcription sample. The method involves synthesizing single-stranded cDNA by incubating the sample RNA with reverse transcriptase and an oligonucleotide primer that primes synthesis in a direction toward 5' end of the RNA; converting the single-stranded cDNA into double-stranded cDNA to form a transcription sample containing a cDNA template; eliminating single-stranded oligonucleotide from the transcription sample; and transcribing the cDNA template into RNA using an RNA polymerase. The method is useful for improving RNA polymerase based RNA transcription from a polynucleotide template. The method inhibits the undesired non-template derived production of RNA in the transcription reaction.
PS	Disclosure; Page 737; 771pp; French.	CC	Sequences ADI34483-ADI34489 represent oligonucleotides used in a T7 RNA transcription reaction.
XX		XX	
CC	The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizopfhrenia).	CC	Sequence 17 BP; 5 A; 6 C; 2 G; 4 T; 0 U; 0 Other;
CC	Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal expression of the nucleotides.	CC

PT	Determining the nucleotide sequence of a nucleic acid analyte - using		
PT	electro-spray ionisation.		
XX			
PS	Example 1; Fig 3A; 25pp; English.		
XX			
CC	The invention relates to an analytical method for determining the		
CC	nucleotide sequence of nucleic acid analytes, including chemically		
CC	modified oligonucleotides. This new method utilises electrospray		
CC	ionisation-Fourier transform mass spectrometry. The ions are excited by		
CC	sustained off-resonance excitation with single shot excitation, and the		
CC	target fragmented by collisionally activated dissociation by a neutral		
CC	gas, e.g. carbon dioxide. Alternatively, the excitation and dissociation		
CC	can be nozzle skimmer dissociation. The method is used in molecular		
CC	biology and biomedical applications. The method, utilising electrospray		
CC	ionisation-Fourier transform ion cyclotron resonance mass spectrometry,		
CC	is extremely rapid and acts directly on the oligonucleotide. The method		
CC	is effective for a variety of nucleic acid analytes, particularly		
CC	chemically modified oligonucleotides which have not previously been		
CC	successfully sequenced. The present sequence represents a		
CC	phosphorothioate oligodeoxynucleotide

XX Providing mRNA profile, by generating two independent patterns
PT characteristic of sample mRNA population, analyzing patterns, comparing
PT gene expression by cell types under varied conditions, and identifying
PT genes.
XX
PS Disclosure; Fig 1; 67pp; English.
XX
CC The present invention relates to a method for providing a profile of mRNA
CC molecules present in a sample. The method comprises generating two
CC independent patterns characteristic of the population of mRNA molecules
CC expressed in the sample and analysing the patterns using a combinatorial
CC algorithm, comparing gene expression by different or same cell types
CC under different conditions, and identifying genes having a role in
CC various cellular processes. The method is useful for the analysis and
CC identification of transcribed genes, and fingerprinting. The method can
CC be used to identify genes which play a role in determining various
CC cellular processes, including susceptibility to external factors,
CC development, and disease. The present sequence for a PCR primer is used
CC in the production of a single pattern characteristic of a sample,
CC employing a Type II restriction enzyme (i.e. HaeII) in the methods of the
CC present invention

PT Determining polyadenylation sites within transcribed gene sequences
PT present in a sample comprises assigning to gene fragments gene candidates
PT within a database by comparing signals in the dataset with the database.
XX
PS Example; Fig 2; 81pp; English.
XX

CC The invention relates to determining the presence of and/or identifying a
CC polyadenylation site within a sequence of a transcribed gene or variants
CC present in a sample. The method involves assigning to gene fragments gene
CC candidates within a database by comparing signals in the dataset with the
CC database, the database comprising data representing mRNAs with known

CC polyA sites and/or 'virtual genes' representing a possible
CC polyadenylation site within an actual gene. The method is useful for
CC determining the presence of and/or identifying a polyadenylation site or
CC alternative polyadenylation sites within a sequence of a transcribed gene
CC or sequences of transcribed gene variants present or potentially present
CC in a sample, in identifying gene features, particularly in identifying
CC differences between sequence variants that occur in a population of
CC nucleic acid molecules, especially in identifying or discovering polyA
CC site usage or determining polyA site usage in a nucleic acid sample, and
CC gene variants arising from alternative polyA sites. The present sequence
CC represents a double stranded product DNA fragment

PT Producing a population of double-stranded product DNA molecules, useful
PT for mRNA profiling, comprises amplification by nested polymerase chain
PT reaction.
XX
PS Example; Fig 1; 105pp; English.
XX

CC The invention relates to producing a population of double-stranded
CC product DNA molecules comprising amplification by a nested PCR method.
CC The method is useful in profiling mRNA transcribed in a system under
CC investigation. The oligonucleotides are used as size standards in
CC electrophoresis, and as internal controls allowing for calculation of
CC relative amounts of material present. The present sequence represents a
CC double stranded product DNA, which aids in outlining an approach to
CC production of a single pattern characteristic of a sample, employing a
CC type II restriction enzyme (HaeII)

PT Pharmaceutical composition for treating ailments associated with impaired

PT respiration, has oligo(s) antisense to specific gene(s) or its

PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

PT ubiquinone.

XX

PS Disclosure; SEQ ID NO 5115; 872pp; English.

XX

CC The invention relates to a novel pharmaceutical composition, which has a

CC first active agent comprising an oligonucleotide antisense to the

CC initiation codon, coding region, 5' or 3' end genomic flanking regions,

CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of

CC junctions of genes encoding a polypeptide associated with lung and/or

CC nasal airway dysfunction and a second active agent comprising an

CC antiinflammatory steroid and ubiquinone. A composition of the invention

CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive, a

CC immunosuppressive, and cytostatic activity. The composition may have a

CC use in antisense gene therapy. The composition is useful for treating or

CC preventing a respiratory, lung or malignant disease or condition, also

CC for enhancing the prophylactic or therapeutic respiratory effect of an

CC antiinflammatory steroid in a subject, for reducing or depleting levels

CC of, or reducing sensitivity to adenosine, reducing levels of adenosine

CC receptor, producing bronchodilation, increasing levels of ubiquinone or

CC lung surfactant in a subject's tissue, or treating bronchoconstriction,

CC lung inflammation, lung allergies, or a respiratory disease or condition.

CC Note: The sequence data for this patent is not represented in the printed

CC specification, but was obtained in electronic format directly from WIPO

CC at ftp.wipo.int/pub/published_pct_sequences

PT Pharmaceutical composition for treating asthma, has antisense

PT oligonucleotide containing less percentage of adenosine, targeted to

PT nucleic acids associated with lung airway or lung dysfunction, and

PT bronchodilating agent.

XX

PS Claim 15; SEQ ID NO 5115; 763pp; English.

XX

CC This invention describes a novel composition (a) a first active agent,

CC comprising oligonucleotides, effective for alleviating

CC bronchoconstriction, respiratory tract inflammation, allergies and

CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,

CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

New antisense compound targeted to a nucleic acid molecule encoding
mammalian glucocorticoid receptor, useful for treating diabetes, obesity,
cardiovascular disorder, hyperlipidemia or Cushing's syndrome.

PS Claim 4; SEQ ID NO 3884; 985pp; English.
XX
CC The invention comprises an antisense oligonucleotides that are targeted
CC to nucleic acids encoding a mammalian glucocorticoid receptor. The
CC antisense oligonucleotides of the invention are useful for preventing or
CC delaying infection, inflammation or tumour formation. The antisense
CC oligonucleotides are also useful for treating diabetes, obesity,
CC cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The
CC present DNA sequence represents an antisense oligonucleotide that targets
CC the human glucocorticoid receptor gene. NOTE: The present sequence
CC contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.

New antisense compound targeted to a nucleic acid molecule encoding
Nav1.3, useful for treating a disease or condition associated
with Nav1.3, e.g. pain, seizure disorder such as childhood seizure
disorder, or ataxia.

Claim 4; SEQ ID NO 2548; 417pp; English.
XX
CC The present invention relates to an antisense compound targeted to a
CC nucleic acid molecule encoding Nav1.3, where the antisense compound
CC specifically hybridizes with and inhibits the expression of Nav1.3. The
CC compound and composition are useful for treating a disease or condition
CC associated with Nav1.3, e.g. pain including but not limited to
CC neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain,
CC diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain,
CC pain from burns, migraine headache, cluster headache, mild-to-moderate
CC headache; seizure disorder such as childhood seizure disorder, including
CC but not limited to neonatal or infantile epilepsy; or ataxia. The present
CC sequence represents a chimeric phosphorothioate oligonucleotide with
CC 2'MOE wings and a deoxy gap. Used during the antisense inhibition of
CC human Nav1.3 expression, the oligonucleotides are designed to target

PT Analysis of cDNA and gene expression - by amplification of mRNA followed
PT by digestion with restriction enzymes.
XX
PS Disclosure; Page 6; 11pp; Japanese.
XX
CC A method for the analysis of cDNA comprises (a) preparing an aggregate of
CC double-stranded cDNAs by using an aggregate of mRNAs and a plural type of
CC labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)
CC and using the aggregate of mRNAs as the template for each reverse
CC transcription primer; (b) digesting each of the prepared aggregates of
CC the double-stranded cDNAs with restriction enzyme and; (c)
CC electrophoresing the digested aggregate of cDNAs in separate lanes. The
CC method can be used to analyse gene expression rapidly and easily

Anti:sense oligo:nucleotide(s) complementary to hepatitis C viral genome
- useful for inhibiting HCV replication, to treat related diseases.

Example 7; Page 24; 91pp; English.

Antisense oligonucleotides were synthesised which are complementary to
target sequences located at 10-nucleotide intervals from nucleotide 1 to
339 in the HCV RNA 5'-untranslated region. Of these sequences (CAS-1 to a
CAS-320), oligonucleotide CAS-110 (AAQ58403), which is complementary to a
portion of loop C, was found to cause greater than 80% inhibition of core
protein translation. The nucleotide at position 119 in loop C has a high
variation rate among HCV strains so oligonucleotide CAS-110-I-119 was
synthesised in which inosine replaced the T (corresp. to A at position
119) in CAS-110. The CAS-110-I-119 showed an inhibitory activity of more
than 70%. A control oligonucleotide (CAS-110-G-119) showed much lower
activity. See AAQ58388-Q58422, AAQ44885-Q44892 and AAQ58383. (Updated on
25-MAR-2003 to correct PN field.)

PT Efficient sequencing of long DNA by fragment walking - with simultaneous
PT sequencing of restriction enzyme fragment and adjacent region of intact
PT DNA, avoids the need for cloning and requires fewer primers.
XX
PS Example 1; Page 11; 50pp; English.
XX
CC A method for DNA analysis based on a complementary extension reaction
CC using a DNA polymerase, comprises a combination of fragment walking and
CC DNA sequencing. DNA fragments are formed by digestion of DNA with a
CC restriction enzyme and the targeted DNA sequence can be determined
CC directly from the digested DNA fragments. By exploring the overlapping
CC sequence of the determined base sequence, the overall base sequence of a
CC lengthy DNA can be determined with low redundancy without cloning or
CC subcloning. In addition, the method can be done with commercially

```

CC available universal primers or with fewer primers than required in
CC existing methods. AAT73291-92 are primers used in determination of the
CC pUC19 sequence. Primer extension was carried out using 16 primers

PT New oligo-nucleotide(s) complementary to untranslated regions of
PT housekeeping genes - are useful in, e.g. identifying modulators of tumour
PT growth/metastasis and inhibiting growth of neoplastic cells.
XX
PS Claim 4; Page 29; 64pp; English.
XX
CC The present sequence represents a 3'-untranslated region (3'UTR) fragment
CC of ribonucleotide reductase R1. The present invention describes: (1)
CC oligonucleotides (ON) comprising at least 7 consecutive nucleotides (nt)
CC or their analogues of a UTR of a housekeeping gene; (2) antisense ON
CC (AON) complementary to ON; (3) ribozymes (Rb) complementary or homologous
CC to ON, and able to cleave it; (4) DNA sequence encoding ON, OAN and Rb;
CC (5) an antibody (Ab) that binds to ON, OAN and Rb; (6) a nt probe ntP
CC that hybridise to ON, OAN and Rb. ON, AON, Rb and Ab are used to modulate
CC (especially inhibit) growth of tumour cells (especially neoplastic cells)
CC and to reduce their capacity for metastasis. The above may also be used
CC to treat benign proliferative disorders e.g. papillomas, atherosclerosis,
CC angiogenesis and viral infections, e.g. human immunodeficiency virus,
CC hepatitis or herpes. ON may further be used: (i) to identify modulators
CC of tumour growth/metastasis; (ii) to identify compounds (especially
CC potential antitumour agents) that inhibit or enhance interaction between
CC ON and its binding substances; (iii) as probes for detecting related
CC sequences, and (iv) to generate Ab, used for detection and quantification
CC of UTR especially for monitoring progress of cancer therapy. SON inhibit
CC tumorigenicity of neoplastic cells, particularly where these are
CC resistant to hydroxyurea

PT Antisense oligonucleotides to ribonucleotide reductase genes - used to
PT modulate tumour growth and inhibit tumour cell proliferation.
XX
PS Claim 8; Page 49; 79pp; English.
XX
CC AAV22531-89 represent antisense oligonucleotides which are targeted
CC against the mRNA of the R1 subunit sequence of ribonucleotide reductase.
CC Aberrant expression of the R2 gene, which encodes the second subunit of
CC the ribonucleotide reductase gene, can determine the malignant
CC characteristics of cells. Suppression of R2 and R1 gene expression was
CC found to reduce transformed properties of tumour cells. The antisense
CC oligonucleotides can be used for modulating tumour cell growth, or for
CC inhibiting tumour cell proliferation. They can also be used for
CC increasing the sensitivity of neoplastic cells to chemotherapeutic drugs
CC (especially to hydroxyurea, methotrexate (MTX), and PALA). The antisense
CC oligonucleotides may be used to treat proliferative disorders including
CC leukaemias, lymphomas, sarcomas, melanomas, various other forms of
CC cancer, papillomas, arthrosclerosis, psoriasis, polythemia, mastocytosis,
CC autoimmune diseases, angiogenesis, bacterial infections and viral
CC infections (including HIV hepatitis, or herpes infections)

PT New antisense oligonucleotide, AS-I-618-20, is useful for inhibiting
PT tumor cell growth.
XX
PS Example 3; Page 32; 137pp; English.
XX
CC The present sequence is an antisense oligonucleotide directed against the
CC mRNA encoding the R1 component of mammalian ribonucleotide reductase.
CC Ribonucleotide reductase catalyses the conversion of ribonucleotides to
CC their corresponding deoxyribonucleotides and thus plays an important role
CC in DNA synthesis and cell proliferation. Regulation of ribonucleotide
CC reductase is altered in cultured malignant cells and increased levels of
CC R2 protein and R2 mRNA have been found in pre-malignant and malignant
CC tissues as compared to normal control tissue samples. The present
CC antisense sequence is therefore useful for inhibiting tumourigenicity of
CC neoplastic cells and inhibiting metastasis of tumour cells. It is also
CC useful for increasing sensitivity of neoplastic cells to chemotherapeutic
CC drugs, thus allowing chemotherapeutic treatments to be used in patients
CC who have become resistant or less sensitive to chemotherapy. The sequence
CC may be RNA or DNA and may comprise a modified backbone and/or nucleotide
CC analogues

PT Analyzing target nucleic acid sequences, useful for population genetics,
PT drug development and diagnosing cancer, comprises hybridizing triple
PT forming oligonucleotide and probe to target sequence.
XX
PS Example 2; Page 66; 141pp; English.
XX
CC The sequence is a polypyrimidine oligonucleotide for binding a second
CC reverse phase triplex forming oligonucleotide, RP-TFO, (3' to the SNP) to
CC the target SNP used to analyse Factor V Leiden SNP using the method of
CC the invention. The invention relates to analysing target nucleic acid
CC sequences comprising restricting isolated DNA, hybridising at least one
CC triplex forming oligonucleotide (TFO), adding a 3' to 5' exonuclease to
CC form a protected nucleic acid sequence (PNAS) tail structure, hybridising
CC the captured structure with a single nucleotide polymorphisms (SNP)
CC identification probe and determining the SNP score. The methods can be
CC used for analysing target nucleic acid sequences, especially genomic DNA
CC sequences, to determine if they contain SNPs or short tandem repeats
CC (STRs). The methods can be used to detect SNPs for use in population
CC genetics, drug development, forensics, cancer, genetic disease research,
CC genomic analysis, diagnostics and therapeutics in humans, plants and
CC animals

CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and
CC immunosuppressive, and cytostatic activity. The composition may have a

CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,

CC This invention describes a novel composition (a) a first active agent,
CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung

CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

PT	oligonucleotide containing less percentage of adenosine, targeted to	
PT	nucleic acids associated with lung airway or lung dysfunction, and	
PT	bronchodilating agent.	
XX		
PS	Claim 15; SEQ ID NO 3806; 763pp; English.	
XX		
CC	This invention describes a novel composition (a) a first active agent,	
CC	comprising oligonucleotides, effective for alleviating	
CC	bronchoconstriction, respiratory tract inflammation, allergies and	
CC	reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,	
CC	surfactant depletion or hyposecretion, when administered to a mammal. The	
CC	oligonucleotides are derived from a gene encoding or regulating	
CC	expression of a target polypeptide associated with lung airway or lung	
CC	dysfunction or cancer and can be anti-sense to the corresponding mRNA.	
CC	The invention also describes a kit, that comprises: (a) a delivery	
CC	device, in separate containers, (b) the oligonucleotides, (c)	
CC	instructions for adding a carrier and for use of the kit. The composition	
CC	of the invention has anti-allergic, anti-inflammatory, antiasthmatic,	
CC	analgesic, hypotensive, immunosuppressive and cytostatic activity, is a	
CC	beta-adrenergic agonist. The composition is useful for preventing or	
CC	treating a respiratory, lung or malignant disease. The administered	
CC	composition comprises oligo and is administered to reduce the production	
CC	or availability, or to increase the degradation of the target mRNA or to	
CC	reduce the amount of target polypeptide present in the lungs. The	
CC	pulmonary obstruction, and/or bronchoconstriction and/or lung	
CC	inflammation, allergies and/or surfactant hypoproduction are associated	
CC	with a disease or condition such as pulmonary vasoconstriction,	
CC	inflammation, allergies, asthma, impeded respiration, respiratory	
CC	distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary	
CC	hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary	
CC	transplantation rejection, pulmonary infections, bronchitis or cancer.	
CC	The reduced adenosine content of the anti-sense oligos corresponding to	
CC	thymidines present in the target RNA serves to prevent the breakdown of	
CC	the oligonucleotides into products that free adenosine into the system	
CC	e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to	
CC	prevent any unwanted effects due to it

XX
CC The invention relates to a kit for diagnosing and treating T-cell
CC associated diseases which comprises a panel of nucleic acid primers
CC specifically priming and allowing amplification of each Vbeta gene,
CC VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant
CC rejection and diagnosing and treating T-cell associated diseases
CC including autoimmune diseases, degenerative nervous system diseases,
CC graft versus host disease, hypersensitivity diseases, infectious diseases
CC and neoplastic diseases. Autoimmune diseases include Addison's disease,
CC atrophic gastritis. Degenerative nervous system diseases include multiple
CC sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type
CC I hypersensitivities such as contact with allergens that lead to
CC allergies, Type II hypersensitivities such as those present in
CC Goodpasture's syndrome and Type IV hypersensitivities such as those
CC manifested in leprosy. Infectious diseases include viral infections
CC caused by viruses such as HIV, fungal infections such as those caused by

CC the Yeast genus Candida, parasitic infections such as those caused by
CC schistosomes, filaria and bacterial infections such as those caused by
CC Mycobacterium. Neoplastic diseases include lymphoproliferative diseases
CC such as leukaemias, lymphomas and cancers such as cancer of the brain,
CC breast. The present sequence represents a Vbeta gene repeat sequence.

PS Claim 4; SEQ ID NO 1059; 417pp; English.
XX
CC The present invention relates to an antisense compound targeted to a
CC nucleic acid molecule encoding Nav1.3, where the antisense compound
CC specifically hybridizes with and inhibits the expression of Nav1.3. The
CC compound and composition are useful for treating a disease or condition
CC associated with Nav1.3, e.g. pain including but not limited to
CC neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain,
CC diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain,
CC pain from burns, migraine headache, cluster headache, mild-to-moderate
CC headache; seizure disorder such as childhood seizure disorder, including
CC but not limited to neonatal or infantile epilepsy; or ataxia. The present
CC sequence represents a chimeric phosphorothioate oligonucleotide with
CC 2'MOE wings and a deoxy gap. Used during the antisense inhibition of
CC human Nav1.3 expression, the oligonucleotides are designed to target
CC different regions of the human Nav1.3 RNA.

DR Typing genes that contain polymorphic microsatellite loci, useful for
XX identifying predisposition to disease, by amplification and determining
XX length of amplicons.
PS Example 3; Page 28; 64pp; German.
XX The invention describes a method of typing (M1) a gene (I) that has one
CC or more polymorphic microsatellite loci (PML). The method comprises: PCR
CC amplification of at least one DNA region of (I) that includes PML, using

CC as template a DNA sample containing at least one segment of (I); and
CC determining the length of the resulting amplicon(s). Also described are:
CC a method of determining (M2) microsatellite markers (MM) for
CC predisposition to a disease, associated with a gene that includes one or
CC more PML; and prediagnosis (M3) of diseases associated with gene that
CC include PML. The method is used to identify microsatellite markers, in a
CC disease-related gene, that are associated with a predisposition to
CC diseases and for prediagnosis of such diseases, especially prion diseases
CC but also cystic fibrosis, malignant hyperthermia syndrome in pigs and
CC metabolic diseases; also to type genes that encode milk proteins,
CC hormones or transcription factors. The method is simpler, quicker and
CC particularly less expensive than known methods based on sequencing. This
CC sequence represents a primer used to genotype a region of the cow prion
CC protein (PrP) comprising a polymorphic microsatellite locus.

XX
PT Novel isolated nucleic acid encoding a promoter which is capable of
PT driving chemically inducible but not wound- or pathogen-inducible
PT expression of an associated nucleotide sequence.

PS Example 3; Page 30; 88pp; English.

XX
CC The invention relates to an isolated nucleic acid molecule (a promoter of
CC rice chemically induced cDNA (RCI-1), which encodes a lipoxigenase)
CC capable of driving chemically-inducible but not wound- or pathogen-
CC inducible expression of an associated nucleotide sequence. Also included
CC are the RCI-1 cDNA, its encoded protein, a 4.5kb genomic clone for the
CC lipoxigenase gene, promoter fragments, the lipoxigenase transit peptide
CC which directs expressed proteins to the plastid, a vector comprising the
CC promoter or fragments and a transgenic plant comprising the vector. The
CC promoter or fragments are useful for expressing a nucleotide sequence of
CC interest. The transit peptide is useful for targeting an associated
CC protein of interest to plastids. A nucleic acid which expresses
CC polypeptide having lipoxigenase activity is useful for inhibiting fungal
CC mycotoxins when transformed into a plant. The lipoxigenase is useful for
CC inhibiting fungal mycotoxins. The promoter is useful for regulating
CC transcription of a chemically inducible but not wound or pathogen
CC inducible gene, which involves applying a chemical regulator to a plant
CC or seed containing a chemically regulatable nucleotide sequence.
CC Transgenic plants as described above are useful for breeding improved
CC plant lines that for example increase the effectiveness of conventional
CC methods such as herbicide or pesticide treatment or allow to dispense

CC with the methods due to their modified genetic properties. New crops with
CC improved stress tolerance can be obtained that, due to their optimised
CC genetic equipment yield harvested product of better quality than products
CC that were not able to tolerate comparable adverse developmental
CC conditions. The present sequence is an anchored oligo-dt reverse RT-PCR
CC primer (reverse transcriptase PCR) used to isolate the cDNA encoding rice
CC lipoxigenase

XX DNA fragment coding for Papillomavirus antigenic proteins - and derived
PT immunogen, vaccine and antibody.

XX Claim 6; Page 16; 25pp; French.

XX The inventors claim DNA fragments capable of expressing, in a host, a
CC prod. contg. at least one antigenic determinant of papillomavirus (PV),
CC (see AAN30170-N30173). Also claimed are immunogens consisting of at least
CC one peptide sequence coded for by the DNA fragments (see AAP30310-
CC P30313), vaccines contg. the immunogens and antibodies raised from them.
CC The vaccines are useful in human and veterinary medicine and the
CC antibodies are useful as diagnostic reagents. The DNA fragments are most
CC esp. derived from the L1 region of human PV type 1a

PT doublet in a DNA duplex, for treating and diagnosing HIV, hepatitis,
PT herpes malignancy and inflammation.
XX
PS Claim 11; Page 64; 77pp; English.
XX
CC The sequence depicts a HUMNFR (tumour necrosis factor receptor) mRNA
CC sequence beginning at nucleotide 2354. The sequence is a viral duplex
CC sequence contg. a purine-rich region concentrated on one chain of the
CC duplex. The sequence may be prepd. by standard DNA synthesis. The HUMNFR
CC duplex sequence is used as a target for novel oligomers which are capable
CC of forming a triplex at physiological pH by coupling into the major
CC groove of the DNA duplex. Three such oligomers TNFR 941-32 are capable of
CC forming a triplex with this sequence. The oligomers are used in the
CC treatment of inflammation. Similar oligomers may be used to target viral
CC DNA duplexes specific for HIV, herpes and other viruses. The triple
CC helices form under mild conditions thus assays may be carried out without
CC subjecting the test specimen to harsh conditions. The oligomer is able to
CC inhibit gene expression, as verified by in vitro systems. See also
CC AAQ25452-25500 and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN
CC field.)

CC The present invention describes a short interfering nucleic acid (siNA)
CC that downregulates expression of a mitogen-activated protein kinase
CC (MAPK) genes by RNA interference. Also described: (1) a method for
CC modulating expression of MAPK genes in cells, tissue explants or
CC organisms by introduction of siNA; (2) kits for in vitro or in vivo
CC delivery of siNA; (3) conjugates and/or complexes of siNA; and (4)
CC vectors that express siNA and cells containing these vectors. MAPK siNAs
CC have cytostatic, anorectic, antidiabetic, antiinflammatory, antiasthmatic,
CC immunosuppressive, antibacterial, antirheumatic, antirheumatic,
CC antiarthritic, antipsoriatic and gastrointestinal activities. The MAPK
CC siNAs can be used to modulate the expression of MAPK genes, in cells,
CC tissue explants or organisms, e.g. for treating obesity; diabetes types I
CC and II; a wide range of tumours, and inflammatory diseases (asthma,
CC septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel
CC disease). They can also be used for drug screening; diagnosis; target
CC identification and validation; genetic engineering; pharmacogenomics;
CC studying gene function and gene mapping (e.g. of single-nucleotide
CC polymorphisms). The present sequence represents a MAPK siNA which is used
CC in the exemplification of the present invention.

XX
XX Pharmaceutical composition for treating asthma, has antisense
PT oligonucleotide containing less percentage of adenosine, targeted to
PT nucleic acids associated with lung airway or lung dysfunction, and
PT bronchodilating agent.
XX
PS Claim 15; SEQ ID NO 3936; 763pp; English.
XX
CC This invention describes a novel composition (a) a first active agent,
CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

PT Efficient sequencing of long DNA by fragment walking - with simultaneous
PT sequencing of restriction enzyme fragment and adjacent region of intact
PT DNA, avoids the need for cloning and requires fewer primers.
XX
PS Example 1; Page 11; 50pp; English.
XX
CC A method for DNA analysis based on a complementary extension reaction
CC using a DNA polymerase, comprises a combination of fragment walking and
CC DNA sequencing. DNA fragments are formed by digestion of DNA with a
CC restriction enzyme and the targeted DNA sequence can be determined
CC directly from the digested DNA fragments. By exploring the overlapping
CC sequence of the determined base sequence, the overall base sequence of a
CC lengthy DNA can be determined with low redundancy without cloning or
CC subcloning. In addition, the method can be done with commercially
CC available universal primers or with fewer primers than required in
CC existing methods. AAT73291-92 are primers used in determination of the
CC pUC19 sequence. Primer extension was carried out using 16 primers

PT Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 2924; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition.

XX New antisense compound targeted to a nucleic acid molecule encoding
XX mammalian glucocorticoid receptor, useful for treating diabetes, obesity,
XX cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
PS Claim 4; SEQ ID NO 4292; 985pp; English.
XX The invention comprises an antisense oligonucleotides that are targeted
XX to nucleic acids encoding a mammalian glucocorticoid receptor. The
XX antisense oligonucleotides of the invention are useful for preventing or
XX delaying infection, inflammation or tumour formation. The antisense
XX oligonucleotides are also useful for treating diabetes, obesity,
XX cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The
XX present DNA sequence represents an antisense oligonucleotide that targets
XX the human glucocorticoid receptor gene. NOTE: The present sequence
XX contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.

DR New immunostimulatory nucleic acid molecule having pyrimidine-purine
XX dinucleotide and a chimeric backbone, useful in treating and preventing
XX asthma, allergy, cancer, infectious disease, autoimmune disease or airway
XX remodeling.
PS Example 28; SEQ ID NO 376; 276pp; English.
XX The invention relates to an immunostimulatory nucleic acid molecule
XX comprising an internal pyrimidine-purine (YZ) dinucleotide and chimeric
XX backbone, where one internal YZ dinucleotide has a phosphodiester(-like)
XX internucleotide linkage, where optionally each additional internal YZ
XX dinucleotide has a phosphodiester(-like) or stabilised internucleotide
XX linkage, where other internucleotide linkages are stabilised. The
XX oligonucleotide is useful in stimulating or modulating an immune
XX response. The medicament shifts the immune response to a Th1 biased
XX response from a Th2 biased response. The oligonucleotide is also useful
XX in the manufacture of a medicament for treating asthma, allergy, cancer,
XX infectious disease, autoimmune disease, airway remodeling or chronic
XX obstructive pulmonary disease or in treating a subject who is a smoker or
XX who is free of symptoms of asthma. The oligonucleotide is useful in
XX inducing cytokine expression, e.g. IL-6 (interleukin-6), TNFalpha (tumour
XX necrosis factor alpha), IFNalpha (interferon-alpha), IFNgamma (interferon
XX -gamma) and IP-10 (interferon inducible protein). The oligonucleotide is
XX also useful in treating and preventing infections caused by viruses,
XX bacteria and parasites. The present sequence represents an
XX immunostimulatory nucleic acid.

PT New nucleoside derivatives with photolabile protecting groups, useful in
PT oligonucleotide synthesis, particularly on solid phases, e.g. for
PT hybridization testing.
XX
PS Disclosure; Fig 9; 48pp; German.
XX
CC This invention describes nucleoside derivatives (I) with photolabile
CC protecting groups. (I) are used to synthesize oligonucleotides using the
CC photolithographic nucleic acid chip method, particularly where these are
CC intended for performing enzymatic reactions initiated from a free 3'-
CC hydroxy (especially solid-phase polymerase reactions or ligase reactions,
CC but also reverse transcription, cDNA synthesis etc.), also for
CC hybridization testing, sequencing and in DNA computing. (I) are produced
CC with high selectivity by reaction with a mild acylating agent that has
CC high specificity for the 3'-position, without significant side-reactions
CC (cf. more reactive acylating agents such as chloroformates)

PT useful for detecting specific nucleic acids, e.g. for single-nucleotide
PT mismatch discrimination.
XX
PS Disclosure; Page 58; 105pp; English.
XX
CC The present sequence is that of the oligonucleotide (ODN) component of an
CC ODN-MGB (minor groove binder)-LF (latent fluorophore) conjugate of the
CC invention. MGBs bind in a non-intercalating manner to the minor groove of
CC non-single-stranded DNA, RNA or their hybrids, while a LF binds similarly
CC but in an intercalating manner, or lies in the minor groove, or is
CC oriented in some other way to the DNA molecule by MGB, such that it
CC becomes fluorescent (or its fluorescent properties change detectably).
CC The conjugates are used as hybridisation probes and amplification primers
CC for fluorescent detection of specifically hybridising sequences, for
CC analysis or diagnosis, especially (real-time) PCR, for single-nucleotide
CC mismatch discrimination, target or signal amplification, array-based
CC assays and sequencing, including detection of double-stranded DNA by
CC triplex formation. Many different targets can be detected a single
CC reaction vessel. The present ODN-MGB-LF conjugate was used to demonstrate
CC hybridisation-triggered fluorescence. Upon hybridisation to the
CC complementary target sequence there was an increase in fluorescence
CC yield, measured as the ratio of the fluorescence emitted by the hybrid
CC between the ODN-MGB-LF conjugate and its target sequence to the
CC fluorescence emitted by unhybridised (i.e. single-stranded) ODN-MGB-LF,
CC of 8.3

XX Sensitively detecting proximity changes in a system that utilizes an
PT interacting fluorophore and quencher, for high sensitivity applications,
PT involves utilizing a metal surface as quencher.
XX
PS Example 3; Page 30; 62pp; English.

XX The present sequence is that of a perfectly matched target sequence for a
CC molecular beacon comprising an oligonucleotide probe (see ABL57069)
CC covalently attached at the 3' end to fluorescent dye and at the 5' end to
CC a nanoparticle. In the native state, the probe forms a hairpin
CC conformation with hybridised termini. The proximity of the fluorophore
CC and quencher (gold nanoparticle) in the molecular beacon results in
CC little or no detectable fluorescence. Upon hybridisation of the central
CC complementary stretch of the probe to a target sequence, such as the
CC present sequence, the hairpin undergoes a conformational change resulting
CC in an increase in fluorescence, the extent of which is proportional to
CC the amount of target sequence present. Single mismatches can be detected.
CC The invention relates generally to the use of metal surface quenchers
CC such as particles or films for high sensitivity applications in, for
CC example, detection and diagnostic systems

PT Oligonucleotides analogs useful in detection, separation and purification
PT of nucleic acid molecules, comprise monomers, dimers and oligomers.
XX
PS Example 17; Page 118; 197pp; English.
XX
CC This invention relates to oligonucleotide analogues comprising a protein
CC nucleic acid molecule (PNA) monomer. They are used in the detection and
CC separation of nucleic acid molecules and as probes, primers, linkers,
CC adaptors and antisense agents on solid supports. Modifications enhance
CC their use as capture and detection probes e.g. by the incorporation of
CC biotin, digoxigenin, radioisotopes, fluorescent labels such as
CC fluorescein and reporter molecules such as alkaline phosphatase. They are
CC also used for enhancing or inhibiting the activity of an enzyme or
CC cellular activity. The compounds are stable to nucleases and proteases,
CC have high affinity, binding specificity and solubility. The polyamide
CC backbone of PNAs is resistant to both nucleases and proteases. PNAs bind

CC nucleic acid molecules with greater affinity than DNA or RNA
CC concentration. The compounds are relatively simple to synthesize and are
CC used in a wide variety of applications. This sequence represents a DNA
CC oligomer which is used to represent the thermal stability of the
CC oligomers of the invention

PT Novel acyclic linker-containing oligonucleotide useful for preventing or
PT decreasing translation, reverse transcription and/or replication of a
PT target RNA in a system, comprises a modified deoxyribonucleotide.
XX
PS Example 2; Fig 7; 104pp; English.
XX
CC The invention relates to an acyclic linker-containing oligonucleotide
CC comprising at least one modified deoxyribonucleotide. Oligonucleotides of
CC the invention are useful for preventing or decreasing translation,
CC reverse transcription and/or replication of a target RNA in a system.
CC They are useful for selectively preventing gene expression in a sequence-
CC specific manner, for hybridising to complementary RNA such as cellular
CC mRNA or viral RNA, to hybridise to and induce cleavage of complementary
CC RNA. They are also useful therapeutically in formulations or medicaments
CC to prevent or treat a disease characterised by the expression of a
CC particular target RNA. The invention is used in gene therapy. The present

CC sequence is an antisense oligo used to elicit human RNase (ribonuclease)
CC H degradation of target RNA. This sequence is used in the exemplification
CC of the invention

PT Detecting polynucleotides, for pharmacogenetic testing, comprises
PT contacting a target polynucleotide with a complementary single-stranded
PT sensor polynucleotide and an agent that allows the sensor to fluoresce
PT upon excitation.
XX
PS Example 1; Page 25; 41pp; English.
XX
CC The invention relates to a novel assay for detecting a polynucleotide in
CC a sample, which comprises: contacting a sample suspected of containing a
CC target polynucleotide with a predetermined single-stranded sensor
CC polynucleotide complementary to the target polynucleotide, in a solution
CC comprising an agent that is a nonaqueous solvent that allows the sensor
CC polynucleotide to produce a detectable fluorescence emission; exciting
CC the sensor polynucleotide; and determining fluorescence emission. The
CC assay is useful for detecting a single or double-stranded target
CC polynucleotide, such as, DNA or RNA in a sample. The assay finds use in a
CC wide variety of different applications including pharmacogenetic testing,
CC forensic testing to identify the species or individual which was the
CC source of a forensic specimen, in anthropological setting, paternity
CC testing, testing for compatibility between prospective tissue or blood
CC donors and patients and in screening for hereditary disorders. The method
CC is also useful to study alterations of gene expression in response to a
CC stimulus, disease, drug or medication, and other applications include
CC human population genetics, analyses of human evolutionary history and
CC characterisation of human haplotype diversity. The method is useful for
CC detecting polynucleotide sequences from contaminants or pathogens

CC including bacteria, yeast, and viruses to detect single nucleotide
CC polymorphisms, which may be associated with particular alleles or subsets
CC of alleles. The method is useful for detection of mutations and to detect
CC nucleotide sequences associated with increased risk of diseases or
CC disorders including cystic fibrosis, Tay-Sachs, and sickle-cell anaemia.
CC This polynucleotide sequence represents an oligonucleotide sequence used
CC in a fluorescence technique of the invention

XX
PS Disclosure; Col 15-16; 168pp; English.
XX
CC The present sequence represents a potential triple-helix forming region.
CC It can be used to demonstrate the assay of the invention. The assay
CC comprises adding a sample containing double-stranded DNA test sequences,
CC e.g. containing the present sequence, to an aqueous medium containing at
CC least one complex of anchor DNA, attached to a solid support, and
CC reporter DNA, where either a part of the anchor DNA or reporter DNA is
CC designed to form a triple-strand structure with part of the test
CC sequence. Triplex formation results in displacement of the reporter DNA
CC which is detected as an indication of the presence of the DNA test
CC sequence. The method is used to detect DNA sequences, particularly for
CC identification of bacteria (by detecting genes for ribosomal RNA) in
CC clinical samples, but also detection of oncogenes and Hepatitis B virus

XX Gene highly expressed in patients with high cedar pollen-specific IgE
PT levels, useful for diagnosing pollenosis, and screening candidate
PT compounds for pollenosis treatment.
XX Example 6; Page 38; 44pp; Japanese.
PS This sequence represents a PCR primer used in the identification of a
XX human pollenosis associated gene. The gene is highly expressed in
CC individuals with high pollen-specific immunoglobulin E (IgE) levels. The
CC invention relates to the nucleotide sequence encoding the pollenosis
CC associated protein, diagnosing pollenosis and screening candidate
CC compounds for treating pollenosis. The gene can be used in diagnosing
CC pollenosis, particularly cedar pollenosis, and screening candidate
XX compounds for pollenosis treatment

PT proteins encoded by them, and antibodies to those proteins.
XX

PS Claim 3; Page 170; 180pp; Japanese.
XX This invention describes novel DNA sequences preferentially expressed in
CC IgA nephropathy patients, and DNA sequences stringently hybridizing to
CC them. Independent claims cover diagnostic reagents for IgA nephropathy
CC incorporating the antisense sequences; the treatment of IgA nephropathy
CC using the antisense sequences for mRNA inhibition; proteins associated
CC with IgA nephropathy, containing sequences encoded by the DNA sequences;
CC antibodies recognizing these proteins; the production of the proteins by
CC culture of host cells transformed with DNA encoding them; diagnostic
CC reagents for IgA nephropathy containing the antibodies; and compositions
CC for the treatment of IgA nephropathy which contain the antibodies. The
CC products of the invention can be used for the diagnosis and treatment of
CC IgA nephropathy. This sequence represents a primer used in the isolation
CC and identification of the human IgA nephropathy-associated proteins
XX described in the method of the invention

XX New nucleic acids that interact, and optionally cleave, target sequences,
PT used to treat cancer.
XX Claim 77; Page 79; 148pp; English.
XX The present invention describes nucleic acids (A) that interact stably
CC with a target sequence and contain at least one phosphoro(di)thioate
CC link, having endonuclease activity. (A), and more generally any catalytic
CC nucleic acid (A') that modulates expression of the oestrogen receptor
CC gene, are used to treat cancer (particularly of breast or endometrium),
CC in vivo or by transforming cells ex vivo and implanting treated cells, or

CC for other conditions associated with levels of oestrogen receptor.
CC Because of the high selectivity for targeted RNA, (A) can also be used to
CC correlate inhibition of gene expression with alterations in phenotype,
CC particularly for identification of therapeutic targets, and as research
CC reagents (for RNA, in the same way that restriction endonucleases are
CC used with DNA). The combination of modifications in (A) improves
CC resistance to nucleases, binding affinity and/or activity. AAA23503 to
CC AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and
CC AAA24748 to AAA25992 represent their corresponding target sequences.

DR Pollinosis-associated gene 787 undergoing significantly low expression in
XX subjects after pollen scattering, useful in diagnosis of allergic
PT diseases and screening candidate compounds to regulate response of T
PT cells to antigen stimulus.
XX Example 6; Page 40; 54pp; Japanese.
PS The invention relates to the human pollinosis-associated gene 787 which
XX exhibits significantly reduced expression in the T-cells of individuals
CC after the pollen-scattering season, relative to expression levels in T-
CC cells before the pollen-scattering season. The gene was isolated from T-
CC cells from individuals allergic to pollen using the differential display
CC method. The invention also relates to pollinosis-associated gene 787
CC primers and probes; methods of detection of pollinosis-associated gene
CC 787 nucleic acids; and a method of diagnosis of allergic diseases via the
CC detection of pollinosis-associated gene 787 nucleic acids. The invention
CC additionally encompasses a method of screening drug candidates for the
CC treatment of allergic disease by measuring the expression of pollinosis-
CC associated gene 787 in pollen antigen-stimulated T-cells in the presence
CC of a test compound relative to a control. Pollinosis- associated gene 787
CC is useful in the diagnosis of allergic diseases and in the screening of
CC drug candidates for the treatment of such diseases. The present sequence
CC represents a PCR primer used in the isolation of human pollinosis-
CC associated gene 787 cDNA

XX
CC The invention relates to a method for examining allergic diseases
CC comprises determining the expression level of a gene containing, the
CC human cDNA appearing as ABK49633 which has homology with
CC acetyltransferases in the eosinophils of a patient and comparing the
CC expression level with that in the eosinophils of a healthy individual
CC (i.e. differential display). Also included are methods of screening for
CC candidate compounds which affect the expression level of the gene or the
CC activity of the protein encoded by the gene (including related proteins
CC and mutants), the use of probes based on the gene sequence in the
CC examination of allergic diseases, the use of reporter constructs in the
CC screening of candidate compounds, a vector containing a the transcription
CC -controlling region of the gene, cells transformed with the vector, an
CC antibody against the protein and a model animal for allergic diseases
CC which is a transgenic non-human vertebrate with lowering of expression
CC intensity of the gene in eosinophils. The method is examining allergic
CC diseases particularly atopic dermatitis which is also applicable in
CC screening candidate compounds for remedies. Such method can be performed
CC in high throughput, at low cost. The present sequence is a differential
CC display PCR primer for the cDNA encoding the human acetyltransferase-like
CC protein 20-90-05

XX Identifying a candidate polymorphic repeat within a coding sequence, for
PT understanding or treating genetic disease, comprises detecting tandem
PT repeats in a target coding sequence and scoring the repeats for
PT polymorphic probability.
XX Example; Col 483; 588pp; English.
XX The invention discloses a method for identifying a candidate polymorphic
CC repeat within a coding sequence (expressed sequence tag, EST), which
CC comprises detecting tandem repeats in a target coding sequence, scoring
CC the repeats for polymorphic probability and generating a dataset
CC correlating the repeats with polymorphic probability to identify a
CC candidate polymorphic repeat. The computational methods to identify a
CC marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are
CC useful for identifying and detecting candidate polymorphic repeats in
CC human genes, which can be used to understand, treat or eliminate genetic
CC diseases, predispositions or adverse drug-treatment reactions. Examples
CC of diseases linked to nucleotide repeats are Machado-Joseph, Haw River
CC syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis,
CC myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and
CC spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are
CC the polymorphic repeats identified for a search of human ESTs

PS Example 8; SEQ ID NO 5256; 103pp; English.
PS
XX The present invention relates to novel human zinc finger-containing
CC proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is
CC encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
CC MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC or in manufacturing a medicament for treating or preventing a disorder
CC associated with decreased or increased expression or activity of MDZ3,
CC MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC acids and proteins are also useful for diagnosing or monitoring a disease
CC caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC acids can also be used as probes to detect and characterize gross
CC alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC useful in constructing microarrays for measuring gene expression. The
CC proteins are useful as therapeutic agents for gene therapy or as
CC vaccines. The present sequence was used to illustrate the invention.

PT MDZ4, MDZ7 or MDZ12, e.g. cancer.
PT
XX
PS Example 8; SEQ ID NO 5258; 103pp; English.
PS
XX The present invention relates to novel human zinc finger-containing
CC proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is
CC encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
CC MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC or in manufacturing a medicament for treating or preventing a disorder
CC associated with decreased or increased expression or activity of MDZ3,
CC MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC acids and proteins are also useful for diagnosing or monitoring a disease
CC caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC acids can also be used as probes to detect and characterize gross
CC alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC useful in constructing microarrays for measuring gene expression. The
CC proteins are useful as therapeutic agents for gene therapy or as
CC vaccines. The present sequence was used to illustrate the invention.

PT Examining allergic diseases, such as atopic dermatitis, comprises
PT comparing the expression levels of gene B1799 in T cells in a patient and
PT a healthy individual.
XX
PS Example 1; SEQ ID NO 5; 87pp; Japanese.
XX
CC This invention relates to a novel method for screening and examining
CC allergic diseases by the use of B1799 as the indicator gene.
CC Specifically, it comprises determining the expression level of this
CC indicator gene in a biological sample obtained from the patient, and
CC identifying differential expression (increased expression of B1799) in
CC comparison to that observed in a healthy individual. The present
CC invention describes the B1799 protein as antiallergic, antiinflammatory
CC and dermatological. As such, through the use of gene therapy, this method
CC can be used to treat allergic diseases particularly atopic dermatitis.
CC Furthermore, it is useful for determining a diagnosis that is convenient
CC and non-invasive, and is also applicable in high throughput screening to
CC identify candidate compounds for additional remedies. This
CC oligonucleotide sequence is the DNA oligo (SeqID 5) related to the human
CC B1799 gene of the invention.

PT Examining allergic diseases e.g. atopic dermatitis by differential
PT display based on gene expression of NOR-1 receptor protein, also
PT applicable in screening compounds for treatment of allergic diseases.
XX
PS Example 1; SEQ ID NO 4; 155pp; Japanese.
XX
CC This invention relates to a novel method for examining allergic diseases
CC that comprises comparing the expression levels of a gene encoding the NOR
CC -1 receptor protein between patients and healthy individuals.
CC Specifically, the NOR-1 gene, also referred to as MINOR, is expressed in
CC the specialist white blood cells known as eosinophils and is involved in
CC mediating an allergic reaction. The present invention describes a
CC differential display method that can identify the expression level of
CC this gene in order to identify its usefulness in diagnosing allergic
CC diseases such as atopic dermatitis. Furthermore, compositions can also be
CC used to screen compounds for the treatment of allergic diseases.
CC Accordingly, they exhibit various activities including antiallergic,
CC antiinflammatory and dermatological. This oligonucleotide sequence is a
CC PCR primer used to amplify human NOR-1 DNA in an exemplification of the
CC invention.

XX Recombinant vaccinia virus containing fusion H1B gag gene - for
PT production in host cells of gag protein for use as vaccine.
PT
XX Example 1; Page 64; 84pp; Japanese.
PS
XX AAV35388-V35414 are primers used in a method which results in a
CC recombinant vaccinia virus comprising of a gag gene from a retrovirus
CC such as HIV-1 or HIV-2, fused to a DNA fragment containing an epitope
CC region (30-300 bases in length) of a retroviral gene other than the gag
CC gene. The gag gene may be altered so as to produce a gag protein modified
CC from the natural sequence by the addition, deletion or substitution of at
CC least 1 amino acid residue. The fusion gene is inserted into a region of
CC a vaccinia virus not essential to its propagation, to give a recombinant
CC vaccinia virus vector which is used to transform a host cell (such as
CC HeLa, Vero, VEF, rabbit kidney RK13 or human myeloma TK-143 cells). Upon
CC culturing the host cell produces particulate structures containing the
CC fusion gag protein. The recombinant vaccinia virus or the fusion gag
CC protein particles may be used in the production of vaccines for
CC protecting against infection with retroviruses such as HIV

PT Functionalized nanocrystal carrying polynucleotide, used for detecting
PT target analyte, forms dendrimers with complementary nanocrystals to
PT amplify the fluorescent signal.
XX
PS Example 3; Page 68; 72pp; English.
XX
CC The present invention relates to functionalised nanocrystals for use in
CC nonisotopic detection systems for biomolecules e.g. nucleic acids,
CC proteins, lipids or drugs. The nanocrystals have polynucleotide strands
CC attached to their surfaces with one end of the polynucleotide extending
CC outwardly from the nanocrystal. The present sequence is one such
CC polynucleotide. These nanocrystals are used with a second series of
CC nanocrystals, which have polynucleotides complementary to the first
CC polynucleotides, so that the respective complementary strands hybridise
CC to each other and form a dendrimer. This dendrimer produces a signal
CC which can then be detected e.g. fluorescence. The present sequence is
CC composed mainly of Adenine bases. This sequence may therefore be used
CC with a polynucleotide composed mainly of Thymine bases (AAA58386)

XX Identifying agents for treatment or prevention of cytomegalovirus

PT infection, comprises contacting test compound with cellular kinase and

PT detecting change in cellular kinase activity.

XX Example 1; Page 13; 49pp; English.

XX The present invention relates to a new method for identifying compounds

CC for treating and/or preventing cytomegalovirus (CMV) infection and/or

CC related diseases. The method of the invention comprises contacting a test

CC compound with at least one of the cellular kinases RICK, RIP, Nck-

CC Interacting kinase, MKK3 and SRPK-2 and detecting any change in kinase

CC activity. The method of the invention can be used to treat and/or prevent

CC CMV infections and related diseases. Oligonucleotides that can detect the

CC specified kinases can also be used for diagnosis of infection. The

CC present nucleic acid sequence represents human CMV reverse transcriptase

CC (RT)-PCR primer TXN that was used in the methods of the invention for

CC preparation of radioactively labelled cDNA probes

XX New pyridylpyrimidine derivatives useful in the treatment or prevention

PT of infectious disease e.g. Kuru syndrome and Creutzfeld-Jacob disease

PT (CJD).

XX

PS Example; Page 38; 96pp; English.

XX The invention relates to novel pyridylpyrimidine derivatives and methods

CC of detecting prion infections and/or prion disease in an individual or in

CC cells, cell cultures and/or cell lysates. The method involves adding at

CC least one monoclonal or polyclonal antibody, oligonucleotide or pyridyl-

CC pyrimidine derivative to the sample or in cells, cell cultures and/or

CC cell lysates and detecting the activity of at least one human cellular

CC protein kinases (e.g., FGF-R1 (also known as flg, Fl-1, Flt-2, b-FGFR),

CC Tkt (also known as CCK-2, DDR-2 or EDDR; EC number 2.7.1.112), Abl (also

CC known as c-abl), clk1, MKK7 (also known as SAPK1a, SAPKalpha), CDC2 (also

CC known as CDK1), PRK), human cellular protein phosphatases such as PTP-SL

CC (also known as MCP83) and PTP-zeta, the cellular signal transduction

CC molecules HSP80 and GIPR-1. The invention is useful for regulating the

CC production of prions in cells and in the manufacture of pharmaceutical

CC composition for prophylaxis and/or treatment of infectious disease (e.g.

CC Scrapie, chronic wasting disease (CWD), transmissible mink encephalopathy

CC (TME), Creutzfeldt-Jacob disease (CJD), bovine spongiform encephalopathy

CC (BSE), variant CJD, Gerstmann-Straussler-Scheinker syndrome (GSS), fatal

CC familial insomnia (FFI), Kuru and Alpers syndrome, especially BSE, CJD,

CC vCJD) or neurodegenerative diseases (e.g., Alzheimer's disease) in humans

CC or ruminants. The present DNA sequence is a primer used to prepare

CC radioactively labelled cDNA probes from RNA. This sequence is used in the

CC exemplification of the invention

XX PT New short interfering nucleic acid, useful e.g. for treatment and

PT diagnosis of prostatic cancer, downregulates expression of the EZH2 gene.

XX PS Example 7; Page 121; 140pp; English.

XX CC The invention relates to short interfering nucleic acids (siNA) which

CC downregulate expression of the human polycomb group protein EZH2 gene by

CC RNA interference. The siNAs may or may not comprise ribonucleotides and

CC may be double or single stranded. They further comprise sense and

CC antisense regions, or alternatively are assembled from a sense

CC oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs

CC include short interfering RNA (siRNA), double-stranded RNA, micro-RNA

CC (miRNA) and short hairpin RNA (shRNA). The siNAs can be unmodified or

CC chemically modified, can contain deoxyribonucleotides, and can be

CC chemically synthesised, expressed from a vector or enzymatically

CC synthesised. The invention also relates to kits for the in vitro or in

CC vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors

CC that express siNA. The siNAs are used to modulate expression of the EZH2

CC gene in cells, tissue explants or organisms (e.g., by ex vivo gene

CC therapy), or in grafts and transplants for the treatment of a variety of

CC conditions. They may be used for treating cancer. The siNAs are also

CC useful for drug screening, diagnosis, therapeutic target identification

CC and validation, genetic engineering, pharmacogenomics, studying gene

CC function, and gene mapping (e.g., of single nucleotide polymorphisms).

CC The present sequence represents the lower strand of a human EZH2 targeted

CC double stranded siNA.

XX
PT Interference RNA agent useful for treating dyslipidemias, coronary artery
PT disease, diabetes, cancer or neurological disease, comprises sense
PT sequence and antisense sequence which has specific modifications.
XX
PS Example 5; SEQ ID NO 6180; 378pp; English.
XX
CC The invention describes a RNA interference (iRNA) agent (I) comprising a
CC sense sequence and an antisense sequence, where the sense sequences have
CC one or more asymmetrical 2'-O alkyl modifications, the antisense
CC sequences have one or more asymmetrical phosphorothioate modifications
CC and the antisense sequence targets a human gene sequence. Also described
CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100
CC levels or glucose-6-phosphatase levels in a subject; producing (I);
CC stabilising (I), involves selecting a sequence with activity and
CC introducing one or more asymmetrical modification while not decreasing its
CC the modification decreases nuclease sensitivity for its use; and a device
CC activity; a kit comprising (I) and instruction for its use; and a device
CC that can be dispense or administer a composition comprising (I). (I) is
CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)
CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)
CC The subject is suffering from a disorder characterised by elevated or
CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted
CC levels of cholesterol, and/or dysregulation of lipid metabolism. The
CC disorder is chosen from the HDL/LDL cholesterol imbalance,
CC dyslipidaemias, hypercholesterolaemia, statin-resistant
CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart
CC disease (CHD) and atherosclerosis. (I) is administered to a subject to
CC inhibit hepatic glucose production or for treating glucose-metabolism-
CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
CC treating the diseases as mentioned above, cancer (e.g. breast, colon or
CC lung cancer), neurological disease (e.g., Huntington disease or
CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
CC represents a hepatitis C virus (HCV) antisense oligonucleotide that can
CC be used to control HCV gene expression.

XX
XX Generating an oligonucleotide for treating diseases, comprises
PT determining from a structure of RNA from an exon, a region that assumes a
PT structure hybridized to another part of the RNA and a region that is not
PT hybridized in the structure.
XX
XX Example 2; Page 48; 71pp; English.
XX
XX The invention comprises a method for generating an oligonucleotide
XX involving: determining from a secondary structure of RNA from an exon, a
XX region that assumes a structure that is hybridised to another part of the
XX RNA (closed structure) and a region that is not hybridised in the
XX structure (open structure); and subsequently generating an
XX oligonucleotide, where at least one part of the oligonucleotide is
XX complementary to the closed structure and at least one part of the
XX oligonucleotide is complementary to the open structure. The gene from
XX which the RNA comprising the exon is transcribed, may be selected from:
XX an aberrant Duchenne muscular dystrophy gene (DMD), a collagen VI alpha 1
XX gene (COL6A1), a myotubular myopathy 1 gene (MTM1), a dysferlin gene
XX (DYSF), a laminin-alpha 2 gene (LAMA2), an emery-dreyfuss muscular
XX dystrophy gene (EMD), and/or a calpain 3 gene (CAPN3). The
XX oligonucleotides produced by the method of the invention are useful for:
XX for the treatment of an inherited disease; for inducing exon skipping in
XX a pre-mRNA; for altering exon-recognition in a pre-mRNA; and for altering
XX the efficiency with which a splice donor or splice acceptor sequence is
XX used by a splicing machinery. The present RNA sequence represents an
XX antisense oligonucleotide that is targeted to the DMD gene.

XX
XX Generating an oligonucleotide for treating diseases, comprises
PT determining from a structure of RNA from an exon, a region that assumes a
PT structure hybridized to another part of the RNA and a region that is not
PT hybridized in the structure.
XX
XX Example 1; Page 88; 117pp; English.
XX
XX The invention relates to generating an oligonucleotide and involves
XX determining from a secondary structure of RNA from an exon, a region that
XX assumes a structure that is hybridised to another part of the RNA (closed
XX structure) and a region that is not hybridize in the structure (open
XX structure), and subsequently generating an oligonucleotide, where at
XX least a part of the oligonucleotide is complementary to the closed
XX structure and at least another part of the oligonucleotide is
XX complementary to the open structure. In generating an oligonucleotide,
XX the open and closed structures are adjacent to each other. The
XX oligonucleotide is complementary to a consecutive part of 14-50
XX nucleotides of the RNA. It also comprises RNA, where the RNA contains a
XX modification, preferably a 2'-O-methyl modified ribose (RNA) or
XX deoxyribose (DNA) modification. The pre-mRNA comprising the exon exhibits
XX undesired splicing in a subject. The absence of the exon from mRNA
XX produced from the pre-mRNA generates a coding region for a protein. The
XX gene from which the RNA comprising the exon is transcribed encodes an
XX aberrant Duchenne muscular dystrophy gene (DMD), a collagen VI alpha 1
XX gene (COL6A1), a myotubular myopathy 1 gene (MTM1), a dysferlin gene
XX (DYSF), a laminin-alpha 2 gene (LAMA2), an emery-dreyfuss muscular
XX dystrophy gene (EMD), and/or a calpain 3 gene (CAPN3). Preferably, the
XX gene is the DMD gene. The oligonucleotide, its equivalent, or the
XX compound is useful for at least in part altering recognition of the exon
XX or exons in a pre-mRNA; for the preparation of a medicament for the
XX treatment of an inherited disease; for inducing exon skipping in a pre-
XX mRNA; for altering exon-recognition in a pre-mRNA; for altering the
XX efficiency with which a splice donor or splice acceptor sequence is used
XX by a splicing machinery; for inducing exon-skipping of two, three, or
XX more exons in a pre-mRNA; or for inducing skipping of the at least two
XX exons and a sequence located between the at least two exons (intervening
XX sequence) on the pre-mRNA, where intervening sequence further comprises
XX exon or exons. Sequences ADS73865-ADS73903 represent antisense
XX oligonucleotides (AONs) used to study targeted skipping of 15 different
XX DMD exons.

XX DR Efficient sequencing of long DNA by fragment walking - with simultaneous
XX PT sequencing of restriction enzyme fragment and adjacent region of intact
XX PT DNA, avoids the need for cloning and requires fewer primers.
XX PS Example 1; Page 23; 50pp; English.
XX CC A method for DNA analysis based on a complementary extension reaction
CC using a DNA polymerase, comprises a combination of fragment walking and
CC DNA sequencing. DNA fragments are formed by digestion of DNA with a
CC restriction enzyme and the targeted DNA sequence can be determined
CC directly from the digested DNA fragments. By exploring the overlapping
CC sequence of the determined base sequence, the overall base sequence of a
CC lengthy DNA can be determined with low redundancy without cloning or
CC subcloning. In addition, the method can be done with commercially
CC available universal primers or with fewer primers than required in
CC existing methods. AAT73291-92 are primers used in determination of the
CC pUC19 sequence. Primer extension was carried out using 16 primers

XX composition for treating e.g., diabetes, cancer or cardiovascular
XX disorder.
XX
XX Claim 3; SEQ ID NO 1995; 555pp; English.
XX
XX The invention describes a new antisense compound, having a sequence
XX comprising 8-30 bp targeted to a nucleic acid encoding endothelial
XX specific molecule-1 (ESM-1), that specifically hybridises with the
XX nucleic acid ESM-1 and inhibits its expression. Also described are: a
XX composition; inhibiting the expression of ESM-1 in cells or tissues; and
XX treating an animal having a disease or condition associated with ESM-1.
XX The compound is useful for preparing a composition for treating diabetes,
XX cancer, ischaemia or reperfusion injury, or angiogenic, immunological,
XX cardiovascular or neurological disorder. This sequence represents an
XX antisense oligonucleotide that can be used to modulate expression of
XX endothelial specific molecule-1 (ESM-1).

XX
PS Example 2; Page 28; 35pp; English.
XX
CC The present invention describes an isolated nucleic acid molecule (I),
CC which encodes a polypeptide (II) required for the viability and/or growth
CC and/or reproduction of nematodes (Caenorhabditis elegans), or its
CC fragment. (I) and (II) have nematocide and plant protectant activities,
CC and can be used in gene therapy. (I) is useful for producing (II)
CC required for the viability, growth and/or reproduction of nematodes.
CC Nucleic acids, probes, polypeptides, fusion proteins and antibodies from
CC the present invention are also useful in a screening assay for
CC interacting drugs that inhibit, stimulate or affect worm growth,
CC viability or reproduction. They are useful for diagnosing or treating
CC human or animal diseases associated with the infection or presence of
CC nematode worms, e.g. Wucheria bancrofti, Brugia malayi, Loa loa or
CC Onchocerca volvulus. These diseases include calabar swellings, lymphatic
CC filariasis (elephantiasis) or onchocercoma. The nucleic acids, probes,
CC polypeptides, fusion proteins and antibodies are also useful for
CC diagnosing or treating plant diseases associated with the infection or
CC presence of nematode worms. Furthermore, the nucleic acid and amino acid
CC sequences are useful for developing computational models, structural
CC models or other models for evaluating drug binding and efficacy. The
CC present sequence represents a primer which is used in an example from the
CC present invention in RNAi experiments

PT New double-stranded short interfering nucleic acid comprises sugar-

PT modified pyrimidine bases useful for treating infection with hepatitis C

PT virus.

XX

PS Example 3; SEQ ID NO 305; 183pp; English.

XX

CC This invention relates to novel double-stranded short interfering nucleic

CC acids (siNA) that inhibits replication of hepatitis C virus (HCV), where

CC one strand is an antisense strand (ASS) that is complementary to (part

CC of) an HCV RNA (portion) and a sense strand (SS) that is complementary to

CC ASS, and where most of the pyrimidine nucleotides comprise a sugar

CC modification. The invention may allow development of compounds with

CC virucide, antiinflammatory, hepatotropic or cytostatic activities by

CC modulation (inhibition) of expression or activity of HCV RNA, by RNA

CC interference. The siNA's of the invention may be used to inhibit

CC replication of HCV, in cells, tissue explants or organisms, for treating

CC HCV infection and its consequences (liver failure; hepatocellular cancer

CC and cirrhosis), and also for drug screening, diagnosis, target

CC identification and validation, genetic engineering, pharmacogenomics,

CC studying gene function and gene mapping (for example of single-nucleotide

CC polymorphisms). The chemical modification improves stability, activity,

CC cellular uptake and/or binding affinity. The siNA can be directed to

CC conserved regions of HCV genes, so are active against many different

CC strains.

PS Claim 20; SEQ ID NO 27; 32pp; English.

XX

CC The present sequence is that of a short interfering RNA (siRNA) molecule

CC targeted to human clusterin ADL70403. The invention relates to the

CC treatment of melanoma through reduction in the effective amount of

CC clusterin. The therapeutic agent may be an antisense oligonucleotide

CC ADL70404-ADL70421 or short interfering RNA (siRNA) ADL70422-ADL70445

CC targeted to clusterin. The siRNAs molecules direct cleavage of clusterin

CC mRNA. A method for regulating expression of bcl-xL in a subject or cell

CC line comprises administering an agent effective to modulate the amount of

CC clusterin expression. In clusterin-expressing cells, expression of bcl-xL

CC is down-regulated when the effective amount of clusterin is reduced. Such

CC inhibition is significant because bcl-xL is known to act as an inhibitor

CC of apoptosis.

XX PT Typing genes that contain polymorphic microsatellite loci, useful for
XX PT identifying predisposition to disease, by amplification and determining
XX PT length of amplicons.

XX PS Example 3; Page 28; 64pp; German.

XX XX The invention describes a method of typing (M1) a gene (I) that has one
XX CC or more polymorphic microsatellite loci (PML). The method comprises: PCR
XX CC amplification of at least one DNA region of (I) that includes PML, using
XX CC as template a DNA sample containing at least one segment of (I); and
XX CC determining the length of the resulting amplicon(s). Also described are:
XX CC a method of determining (M2) microsatellite markers (MM) for
XX CC predisposition to a disease, associated with a gene that includes one or
XX CC more PML; and prediagnosis (M3) of diseases associated with gene that
XX CC include PML. The method is used to identify microsatellite markers, in a
XX CC disease-related gene, that are associated with a predisposition to
XX CC diseases and for prediagnosis of such diseases, especially prion diseases
XX CC but also cystic fibrosis, malignant hyperthermia syndrome in pigs and
XX CC metabolic diseases; also to type genes that encode milk proteins,
XX CC hormones or transcription factors. The method is simpler, quicker and
XX CC particularly less expensive than known methods based on sequencing. This
XX CC sequence represents a primer used to genotype a region of the cow prion
XX CC protein (PrP) comprising a polymorphic microsatellite locus.

 XX
 CC The invention describes a RNA interference (iRNA) agent (I) comprising a
 CC sense sequence and an antisense sequence, where the sense sequences have
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense
 CC sequences have one or more asymmetrical phosphorothioate modifications
 CC and the antisense sequence targets a human gene sequence. Also described

CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);
 CC stabilising (I), involves selecting a sequence with activity and
 CC introducing one or more asymmetrical modification while not decreasing its
 CC the modification decreases nuclease sensitivity while not decreasing its
 CC activity; a kit comprising (I) and instruction for its use; and a device
 CC that can be dispense or administer a composition comprising (I). (I) is
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.
 CC The subject is suffering from a disorder characterised by elevated or
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to
 CC inhibit hepatic glucose production or for treating glucose-metabolism-
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or
 CC lung cancer), neurological disease (e.g., Huntington disease or
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
 CC represents a human glucose-6-phosphatase antisense oligonucleotide that
 CC can be used to control glucose-6-phosphatase gene expression.

Analysis of RNA samples, useful for detection of differential gene
expression uses two differently labeled primers.
Disclosure; Page 10; 10pp; German.

This invention describes a novel method for analysis of an RNA sample
which comprises amplifying cDNA with first and second differently labeled
primers and analysis of the amplified labeled cDNA. The method is useful
for analyzing differential gene expression, for identifying and/or
characterizing pharmacological activities or for identifying target
genes. The use of different primer combinations allow more cDNAs to be
amplified. The method also provides a more detailed analysis than prior
art methods. This sequence represents a primer used to illustrate the
method of the invention

PT Enzymatic nucleic acid molecules having a hammer-head motif - used for
PT the treatment of arthritis, induction of graft tolerance or treatment of
PT auto-immune diseases.
XX
PS Example 1; Page 154; 307pp; English.
XX
CC The present invention describes a novel enzymatic nucleic acid (ENA)
CC having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues
CC ; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least
CC ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's
CC can inhibit collagenase and stromelysin production in the synovial
CC membrane of joints for the treatment or prevention of arthritis,
CC particularly osteoarthritis or rheumatoid arthritis. The ENA's can also
CC be used to treat antigen presenting cells of a donor to induce tolerance
CC in a recipient to an alloantigen of a donor. They can also be used for
CC enhancing graft tolerance or for treating autoimmune disease, and for
CC treating allergies and other inflammatory conditions. The ENA's can also
CC be used in diagnosis. Ribozyme therapy impacts on the expression of
CC stromelysin without introducing the non-specific effects upon gene
CC expression which accompany treatment with retinoids and dexamethasone.
CC The concentration of ribozyme required to affect a therapeutic treatment
CC is lower than that required of antisense molecules, and is highly
CC specific. The present sequence is used in the exemplification of the
CC present invention

PT New nucleic acids that interact, and optionally cleave, target sequences, used to treat cancer.
PT
XX Claim 77; Page 79; 148pp; English.
XX
CC The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thioate link, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium), in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of oestrogen receptor. Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and AAA24748 to AAA25992 represent their corresponding target sequences. AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme sequences, and AAA26107 to AAA26218 represent their corresponding target sequences. AAA26219 to AAA26271 represent other ribozyme sequences and antisense oligonucleotides used in the exemplification of the present invention

XX Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury. XX Claim 88; Page 68; 200pp; English. XX The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NVN motif) pr an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with a YGY motif). The CD20-targeting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg²⁺. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targeting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-targetting nucleic acid is used to cleave RNA of the NOGO gene in the presence of a divalent cation that is preferably Mg²⁺. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present

CC sequence is a hammerhead ribozyme of the invention

PT Probes for detecting target nucleotide sequence in sample, has sequence that forms hairpin structure having a double-stranded segment and single-stranded loop collectively forming region complementary to target sequence.
PS Example 4; Page 49; 72pp; English.
XX
CC The present sequence is that of DNA-RNA-DNA hybrid oligonucleotide AGT02014. This is one of a set of oligonucleotides (see ABA91527-30) used to assess the minimum number of ribonucleotides in DNA-RNA chimeric oligonucleotides required for RNase H cleavage. Each oligonucleotide of the set had a different number of ribonucleotides, 1 in the present case. The oligonucleotides were mixed with target DNA oligonucleotide AGT02009 (see ABA91531) and incubated with RNase H (5 U/ml) at 37 degrees C for 30 minutes. The results showed that 4 ribonucleotides were the minimum number for RNA cleavage. The invention provides probes for nucleic acid hybridisation. The probes form a hairpin structure comprising a double-stranded stem and a single-stranded loop, and are capable of both intramolecular and intermolecular hybridisation. The double-stranded stem may comprise a methylphosphonate DNA:RNA hybrid that is resistant to RNase H cleavage. When the probe hybridises with a target DNA, the RNA strand in the DNA:RNA duplex becomes sensitive to RNase H treatment and can be removed. Arrays and methods for nucleic acid hybridisation using the probes are provided

PT New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins,
PT or as specific biomolecule capture probes for surface-enhanced laser
PT desorption ionization, comprises human myosin-like protein hGDMLP-1.
XX
PS Disclosure; SEQ ID NO 8666; 214pp; English.
XX
CC The present invention describes a human genome-derived myosin-like
CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-
CC 1 can be used in gene therapy and vaccine production. The hGDMLP-1
CC nucleic acids can be used as probes to detect, characterise and quantify
CC hGDMLP-1 nucleic acids in samples, as amplification substrates, to
CC provide initial substrates for the recombinant engineering of hGDMLP-1
CC protein variants having desired phenotypic improvements, and for
CC expressing the proteins. The hGDMLP-1 proteins or polypeptides may be
CC used as immunogens to raise antibodies that specifically recognise hGDMLP
CC -1 proteins, as standards in assays used to determine the concentration
CC and/or amount specifically of hGDMLP proteins, as specific biomolecule
CC capture probes for surface-enhanced laser desorption ionisation, as
CC therapeutic supplement in patients having specific deficiency in hGDMLP-1

CC production, and in vaccines or for replacement therapy. The
CC polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a
CC disorder associated with the expression of hGDMLP-1, in particular heart
CC and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
CC The present sequence represents an oligomer used in the screening of the
CC hGDMLP-1 sequence in the exemplification of the present invention. N.B.
CC The sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from WIPO
CC at ftp.wipo.int/pub/published_pct_sequence

PS Example; Fig 1D; 19pp; English.
XX
CC The invention relates to a method of sequential consensus region-directed
CC amplification for sorting a mixture of DNAs into 2 or more subsets or
CC distinguishing gene expression patterns in 2 samples. The methods, kits
CC and oligonucleotides are useful for sorting a mixture of DNAs into 2 or
CC more subsets or distinguishing gene expression patterns in 2 samples e.g.
CC for disease diagnosis and gene analysis. The present sequence is oligo AT
CC PCR primer used to illustrate the method of the invention

CC The present invention relates to nucleic acid molecules which modulate

CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or

CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense

CC and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes,

CC inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed

CC are nucleic acid decoy molecules and aptamers that bind to HBV reverse

CC transcriptase and/or HBV reverse transcriptase primer sequences, as well

CC as oligonucleotides that specifically bind the Enhancer I region of HBV

CC DNA. The nucleic acids may be used to modulate the expression of HBV

CC genes and HBV viral replication. Also disclosed is a method for screening

CC compounds and/or potential therapies directed against HBV, and compounds

CC that modulate the expression and/or replication of HCV. The compounds

CC methods of the invention are useful for the treatment of degenerative and

CC disease states related to HBV and HCV infection, replication and gene

CC expression such as cirrhosis, liver failure, and hepatocellular

CC carcinoma. The present sequence represents a substrate for one of the HCV

CC DNAzyme or minus strand DNAzyme sequences disclosed in the present

PT useful e.g. for treatment of tumors and viral infection, also related
PT polypeptide and antibodies.
PT
XX Disclosure; Page 713; 771pp; French.
PS
XX The invention relates to the isolation of 6327 nucleotide sequences,
CC fragments of at least 15 consecutive nucleotides of these nucleotides, a
CC sequence having at least 80% identity, after optimal alignment, with the
CC nucleotides, a sequence that hybridizes under stringent conditions with
CC the nucleotides, or the complement, or corresponding RNA, of the
CC nucleotides. The nucleotides are used as probes or primers for detecting,
CC identifying, quantifying and/or amplifying nucleic acids, as in vitro
CC sense and antisense sequences, of nucleotides involved in tumour
CC suppression or reversion, apoptosis and or viral resistance, to produce
CC recombinant polypeptides, and to prepare transgenic animals, as
CC experimental models. The nucleotides (also vectors containing them and
CC cells containing the vectors), the encoded polypeptides and antibodies
CC (Ab) against the polypeptide are useful for prevention and/or treatment
CC of viral infections or diseases characterized by development of tumours
CC or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
CC Analysis of the expression of the nucleotides can be used for diagnosis
CC and/or prognosis of these diseases. The nucleotides and polypeptides can
CC also be used to screen for their specific interactive molecules,
CC potentially useful for treating diseases associated with abnormal
CC expression of the nucleotides.

XX Novel enzymatic nucleic acid that down-regulates expression of neurite

PT growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or

PT protein kinase PKR genes, for treating cancer and inflammatory disease.

XX

PS Claim 59; SEQ ID NO 2940; 317pp; English.

XX

CC The invention comprises nucleic acids (e.g. antisense oligonucleotides)

CC that down regulate the expression or inhibit the function of a receptor

CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),

CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the

CC invention are useful for treating: cerebrovascular accident, central

CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,

CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,

CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune

CC disease, lupus, multiple sclerosis, transplant/graft rejection,

CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic

CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The

CC nucleic acids of the invention are also useful for down-regulating the

CC expression of a target gene and as a diagnostic tool to examine genetic

CC drifts and mutations within diseased cells or to detect the presence of a

CC target RNA in a cell. The present RNA sequence represents a human PKR

CC substrate sequence.

XX Enzymatic nucleic acid molecules which specifically cleave RNA derived

PT from hepatitis C virus (HCV), useful for the treatment of HCV infections,

PT especially in combination with type I interferon therapy.

XX Claim 1; SEQ ID NO 1542; 198pp; English.

PS

XX The invention relates to an enzymatic nucleic acid molecule which

CC specifically cleaves RNA derived from hepatitis C virus (HCV), in which

CC the binding arms of the enzymatic nucleic acid molecule comprises

CC sequences complementary to any of the defined substrate sequences given

CC in the specification. The nucleic acid molecule may be administered for

CC the treatment of HCV infections, especially in combination with type I

CC interferons. The present sequence represents a HCV DNazyme substrate

CC sequence.

XX New DNA encoding protein having juvenile-hormone acid transmethylase
PT activity, useful for screening for a compound controlling the expression
PT level of juvenile-hormone acid transmethylase DNA.

PS Example 1; SEQ ID NO 11; 118pp; Japanese.

XX The invention relates to a DNA (I) encoding a protein (II) having
CC juvenile-hormone acid transmethylase activity selected from the DNA from
CC silkworm (Bombyx mori), Drosophila melanogaster, mosquito (Anopheles
CC gambiae), Spodoptera litura and Helicoverpa armigera, their encoded
CC proteins (S2), DNAs (D2) that hybridize under stringent conditions with
CC the nucleic acids or an amino acid sequence (S3) comprising any one of
CC (S2) in which one or more amino acids are substituted, deleted, inserted
CC and/or added. (I) is useful for screening a compound that controls the
CC expression level of (I), and as a controlling agent of molting and
CC transformation, reproductive, diapause, blastogenesis, action,
CC polymorphism or lifetime of arthropod. (II) is useful for screening a
CC compound having binding affinity with respect to (II), which involves

CC contacting test compound with (II), detecting the binding of (II) with
CC test compound, and selecting the compound that binds with (II). (II) is
CC useful for screening a compound that controls the activity of (II), which
CC involves contacting test compound with (II), measuring the activity of
CC (II), and selecting the compound that decreases or increases the activity
CC of (II), based on comparison of the activity of (II) in absence of test
CC compound. (II) is useful for manufacturing activated juvenile hormone.
CC This sequence corresponds to a PCR primer used to amplify and isolate the
CC transmethylease cDNA from the silkworm Bombyx mori.

XX Novel myosin-like protein-1, useful for treating or preventing disorder

PT associated with decreased expression or activity of human genome-derived
PT myosin-like protein-1 such as disorder of heart and/or skeletal muscle
XX function.
PS Disclosure; SEQ ID NO 8666; Opp; English.
XX
CC The invention relates to a novel polypeptide (I) comprising a sequence
CC (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully
CC defined in the specification, a fragment of at least 8 amino acids of
CC (S1), 95% deviation from (S1) which are conservative substitutions, and
CC 65% identity to (S1). A polypeptide of the invention acts as a agonist or
CC antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A
CC pharmaceutical composition of the invention is useful for treating or
CC preventing a disorder associated with decreased expression or activity of
CC hGDMLP-1, such as a disorder of heart and/or skeletal muscle function.
CC The present sequence represents a 17-mer nucleotide, used in the
CC invention for scanning the sequence represented in ACN63103

XX New oligomers contg. modified bases - which form a triplex with G-C
PT doublet in a DNA duplex, for treating and diagnosing HIV, hepatitis,
PT herpes malignancy and inflammation.
XX
PS Claim 12; Page 72; 77pp; English.
XX
CC The synthetic oligomer is capable of forming a triplex at physiological
CC pH with a purine rich target sequence by coupling into the major groove
CC of the duplex. The specific target sequence of this oligomer is the human
CC tumour necrosis factor receptor mRNA beginning at nucleotide 2354 contg.
CC a purine rich sequence concd. on one strand of the duplex. The oligomer,
CC and others like it are useful in diagnosis and therapy of diseases
CC characterised by specific DNA duplex targets, e.g. HPV, HER, HIV,
CC hepatitis B, herpes, malignant tumours and inflammation. The triple
CC helices form under mild conditions thus assays may be carried out without
CC subjecting the test specimen to harsh conditions. See also AAQ25452-25501
CC and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN field.) (Updated
CC on 25-MAR-2003 to correct PD field.)

XX Zapol, a novel angiopoietin homologue, and related DNA, useful for the
XX study and regulation of angiogenesis and for developing inhibitors.
XX
XX Example 3; Page 55; 56pp; English.
XX
XX PCR primers AAX85603-04 were used to amplify DNA encoding a human growth
XX factor designated zapol. Zapol is an angiopoietin homologue. The
XX polypeptide is used to stimulate cell growth and tissue development. The
XX polypeptides form multimeric proteins. Zapol has angiogenic or
XX hematopoietic activity. The proteins can be used in assays for angiogenic
```

```
CC activity. Zapol proteins may be used therapeutically to stimulate
CC revascularization of tissue. Specific applications include treatment of
CC full-thickness skin wounds, including venous stasis ulcers and other
CC chronic, non-healing wounds, as well as fracture repair, skin grafting,
CC reconstructive surgery, and establishment of vascular networks in
CC transplanted cells and tissues. Zapol is also useful as a research agent,
CC such as in the expansion of hematopoietic cells (including stem cells)
CC and endothelial cells. The polypeptides are added to tissue culture media
CC for these cell types

CC The invention relates to short interfering nucleic acids (siNA) which

CC downregulate expression of the human tumour necrosis factor (TNF)

CC receptor gene by RNA interference. The siNAs may or may not comprise

CC ribonucleotides and may be double or single stranded. They further

CC comprise sense and antisense regions, or alternatively are assembled from

CC a sense oligonucleotide and an antisense oligonucleotide. Specifically,

CC the siNAs include short interfering RNA (siRNA), double-stranded RNA,

CC micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs can be

CC unmodified or chemically modified, can contain deoxyribonucleotides, and

CC can be chemically synthesised, expressed from a vector or enzymatically

CC synthesised. The invention also relates to kits for the in vitro or in

CC vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors

CC that express siNA. The siNAs are used to modulate expression of the TNF

CC receptor gene in cells, tissue explants or organisms (e.g., by ex vivo

CC gene therapy), or in grafts and transplants for the treatment of a

CC variety of conditions. The TNF receptor siNAs have antibacterial,

CC immunosuppressive, antirheumatic, antiarthritic, anti-HIV, antipsoriatic

CC and antiinflammatory activities. They may be used for treating septic

CC shock, rheumatoid arthritis, HIV/AIDS, psoriasis, inflammation and

CC autoimmune diseases. The siNAs are also useful for drug screening,

CC engineering, therapeutic target identification and validation, genetic

CC (e.g., of single nucleotide polymorphisms). The present sequence

CC represents the lower strand of a human TNF receptor-targeted double-

XX stranded siNA.

PT Peptides having at least two new nucleotides - useful as primers in RT-
PT PCR.
XX
PS Example 1; Page 12; 19pp; Japanese.
XX
CC This sequence represents a primer of the invention. The invention relates
CC to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta
CC -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or
CC a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n =
CC natural number indicating the repetition of alpha; beta, delta = V or N;
CC V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or
CC thymine; gamma = thymine; k = natural number of 3 or over indicating the
CC repetition of gamma, in which thymine expressed by gamma is composed of
CC 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are
CC useful as primers for RT-PCR and determination of base sequences. The new
CC sequences allow for reproductive and highly efficient analysis of gene
CC sequences

PT Novel probe sets with common universal linkers at one or both ends (WRAP
PT probes) for gene expression arrays to provide global amplification of
PT probe set and to provide common equivalent signaling regardless of
PT length.
XX
PS Disclosure; Page 88; 97pp; English.
XX
CC The invention relates to a probe set for gene expression arrays to
CC provide common equivalent signalling per probe and global amplification
CC of the set. The probe set has a pool of modified cDNA probes, each probe

CC having a central target specific segment copied from a portion of a
CC single mRNA transcript and a universal linker (a WRAP-Probe) located on
CC one or both terminal ends. The universal linker has reporter binding
CC sites to join common reporters to the probes and primer binding sites to
CC copy and amplify the probe. The probes and reporters are useful in
CC diagnostic or drug discovery assays for a wide range of biomedical
CC samples, including detection of nucleic acids and gene expression
CC profiles in human diagnostics, forensics and genomic analysis. The
CC methods are useful for amplifying and identifying any unknown DNA
CC fragment and also for improving sensitivity with tissue microarrays or
CC RNA arrays. The methods improve the quantification of gene expression and
CC allow highly improved detection of rare transcripts or very small
CC samples. This sequence represents a poly-T primer used in the
CC construction of probe sets

XX New isolated RNAs comprising an intron RNA that is released in a cell,
PT thus modulating the function of a target gene, useful for treating and
PT preventing diseases such as cancer and viral/microbial infections.

XX Claim 2; SEQ ID NO 2; 54pp; English.

XX The invention relates to isolated RNAs comprising an intron RNA that is
CC released in a cell, thus modulating the function of a target gene. Also
CC disclosed is a DNA template for the isolated RNA, an expression vector
CC comprising the DNA, and a composition comprising one or more agents that
CC induce RNA-mediated modulation of the functions of two or more target
CC genes in a cell, such as a mammalian cell. The isolated RNAs and
CC compositions are useful for modulating the function of a target gene in a
CC cell, e.g. to inhibit a cancer-related gene, potential viral gene, and
CC microbe-related gene, and thus useful for treating and preventing
CC diseases such as cancer and viral/microbial infections. The current
CC sequence represents a potential poly-pyrimidine tract of the artificial
CC RNA intron.

CC The present sequence represents a preferred target sequence for an
CC enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the
CC nucleotide base position indicated in the DE line. Regions of the mRNA
CC that do not form secondary folding structures and that contain potential
CC hammerhead and hairpin ribozyme cleavage sites were identified by
CC computer analysis. Ribozymes directed against these mRNA sequences were
CC designed and synthesised with modifications that improve their nuclease
CC resistance. The ribozymes cleave the ICAM-1 target sequences and thereby
CC inhibit ICAM-1 expression, making them useful for reducing transplant
CC rejection and alleviating symptoms in patients with rheumatoid arthritis,
CC asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to
CC correct PI field.)

PT Ribozymes having modified bases and methods for producing them - for use
PT in inhibiting disease related genes.
XX
PS Claim 2; Page 175; 407pp; English.
XX
CC The present sequence represents a preferred target sequence for an
CC enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the
CC nucleotide base position indicated in the DE line. Regions of the mRNA
CC that do not form secondary folding structures and that contain potential
CC hammerhead and hairpin ribozyme cleavage sites were identified by
CC computer analysis. Ribozymes directed against these mRNA sequences were
CC designed and synthesised with modifications that improve their nuclease
CC resistance. The ribozymes cleave the ICAM-1 target sequences and thereby
CC inhibit ICAM-1 expression, making them useful for reducing transplant
CC rejection and alleviating symptoms in patients with rheumatoid arthritis,
CC asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to
CC correct PI field.)

XX Synthesis of N3' to P5' phosphoramidate oligo:nucleotide - by reacting
PT immobilised 3'-amino nucleotide with new amino:nucleoside 5'-
PT phosphoramidite then oxidation, useful as research, diagnostic and
PT therapeutic agents.

XX Disclosure; Page 28; 60pp; English.

XX A new method is provided for the synthesis of oligonucleotides having N3'
CC ->P5' phosphoramidate linkages. The method comprises (a) attaching a 3'-
CC protected amino nucleoside to a solid support; (b) deprotecting the 3'-
CC amino; (c) reacting with a 3'-protected aminonucleoside-5'-
CC phosphoramidite monomer to form an internucleoside N3'-> P5'
CC phosphoramidite link; (d) oxidising this link to phosphoramidate; and
CC optionally repeating steps (b)-(d) until the required oligonucleotide is
CC completed. This method provides better yields with lower reagent
CC consumption than known processes, and can be operated on a large scale.
CC The obtained oligos, containing phosphoramidate linkages, have favourable
CC binding properties, nuclease resistance and solubility, and are useful as
CC research, diagnostic and therapeutic agents. The present sequence is an
CC example of an oligonucleotide in which N3'->P5' phosphoramidate linkages

CC have been introduced by the new method. (Updated on 25-MAR-2003 to

PT      New release tag compounds for detecting target molecule(s) - comprising a
PT      reactive group, a release group and a releasable non-volatile mass label
PT      detectable by mass spectrometry.
XX
PS      Example 3; Page 92; 170pp; English.
XX
CC      The sequence is that of an oligonucleotide primer which was produced as
CC      part of an oligonucleotide peptide conjugate as an example of a release
CC      tag compound (RTC). These comprise a reactive group, a release group and
CC      a non-volatile mass label comprising a synthetic polymer or biopolymer
CC      detectable by mass spectrometry. The RTCs can be used as probes for the
CC      detection of TMs. They can be used for e.g. identification of gene
CC      sequences, identification of non-coding nucleotide sequences,
CC      identification of mutations within a gene or protein sequence, detection
CC      of metals, detection of toxins, detection of receptors on an organism or
CC      a cell, characterisation of antibody-antigen interactions, enzyme-
CC      substrate interactions and characterisation of ligand interactions.
CC      Multiplex applications include multiple pathogen diagnostics, multigene
CC      genetic polymorphism screening, single nucleotide polymorphism (SNP)
CC      genotyping, clone and gene mapping, and gene expression analysis. The
CC      RTCs permit the ready detection of releasable mass labels by mass
CC      spectroscopy. The releasable mass labels permit the multiplexing of tens,
CC      hundreds and perhaps even thousands of different mass labels that can be
CC      used to uniquely identify each desired target

PT Separation of electrically charged target molecules - by capillary
PT affinity gel electrophoresis using polymer-gel to which receptors for
PT target molecules are bound.
XX
PS Example A1; Page 22; 41pp; English.
XX
XX This sequence represents an oligonucleotide receptor molecule covalently
CC bound to a polyacrylamide gel via a linking group. The invention relates
CC to selective separation of electrically charged target molecules in an
CC analytical mixture. It comprises capillary affinity gel electrophoresis
CC using a capillary tube which is at least partly filled with a polymer
CC gel. Receptors for target molecules are covalently bound to the polymer.
CC An electric field of at least 50 volts/cm is applied. The capillary tube
CC is charged with the analytical mixture. In a first separation stage, the
CC target molecules in the mixture are bound to the receptors and the
CC remaining components are eluted, optionally whilst splitting open. In a
CC second stage, the elution conditions are changed, optionally in stages,
CC so that the affinity of the target molecules for the receptor is
CC eliminated and the target molecules are eluted and detected, optionally
CC whilst splitting open. The process is useful for selective separation
CC and/or determination of charged organic compounds, such as
CC oligonucleotides, peptides or carbohydrates. It may be used, e.g. for
CC isolation of specific proteins and DNA molecules, purification of
CC antibodies, analysis of antisense compounds or screening for enzyme
CC inhibitors. The process achieves higher resolution and selectivity than
CC prior art processes, especially in the case of complex biological
CC analytical mixtures. It has high sensitivity, even with small amounts of
CC samples. The derivatised polymers may be synthesised specifically using
CC standard methods

PT Separation of electrically charged target molecules - by capillary
PT affinity gel electrophoresis using polymer-gel to which receptors for
PT target molecules are bound.
XX
PS Example D3; Page 25; 41pp; English.
XX
XX A mixture of oligonucleotides (AAT86604-7) were separated by a new
CC process using capillary affinity gel electrophoresis. The invention
CC relates to selective separation of electrically charged target molecules
CC in an analytical mixture. It comprises capillary affinity gel
CC electrophoresis using a capillary tube which is at least partly filled
CC with a polymer gel. Receptors for target molecules are covalently bound
CC to the polymer. An electric field of at least 50 volts/cm is applied. The
CC capillary tube is charged with the analytical mixture. In a first
CC separation stage, the target molecules in the mixture are bound to the
CC receptors and the remaining components are eluted, optionally whilst
CC splitting open. In a second stage, the elution conditions are changed,
CC the receptor is eliminated and the affinity of the target molecules for
CC detected, optionally whilst splitting open. The process is useful for
CC selective separation and/or determination of charged organic compounds,
CC such as oligonucleotides, peptides or carbohydrates. It may be used, e.g.
CC for isolation of specific proteins and DNA molecules, purification of
CC antibodies, analysis of antisense compounds or screening for enzyme
CC inhibitors. The process achieves higher resolution and selectivity than
CC prior art processes, especially in the case of complex biological

XX Novel ribozymes for the treatment of diseases and conditions related to
PT hepatitis C infection.
XX
PS Claim 1; Page 49; 123pp; English.
XX
CC The present sequence represents the preferred target sequence of an
CC enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves
CC the Hepatitis C virus (HCV) RNA sequence in the 3' non-core region. The
CC HCV sequence was screened for optimal ribozyme target sites using a
CC computer folding algorithm and regions of the mRNA which did not form
CC secondary folding structures and contained potential ribozyme cleavage
CC sites were identified. Ribozymes were synthesised to target these sites
CC and their activities optimised by either varying the length of the
CC binding arms or by modification to prevent degradation by nucleases. The
CC ribozymes of the invention inhibit gene expression and/or viral
CC replication, and are used to treat diseases associated with Hepatitis C
CC virus (HCV) infection, e.g. cirrhosis, liver failure and hepatocellular
CC carcinoma. The ribozymes may be used in combination with interferon to
CC treat HCV infection, other infectious diseases, autoimmune diseases, and
CC cancer

PT New DNA encoding endo-beta-mannanase from coffee, used e.g. in
PT pharmaceutical, cosmetic or food compositions to hydrolyze polymannans.
XX
PS Disclosure; Page 32; 41pp; French.
XX
CC PCR primers AAA46501-02 were used to amplify DNA encoding an endo-beta-
CC mannanase enzyme, which is involved in the hydrolysis of polysaccharides
CC that consist of molecules of mannan, either simple or branched, linked
CC together by beta(1-4) bonds. The mannanase polynucleotide sequence is
CC used for in vivo modification of the coffee endo-beta-mannanase gene. It
CC is also used to produce transgenic plant cells (especially coffee cells)
CC which have modified properties of mannan polysaccharide, and thus altered
CC flavour or structure. The enzyme is used for modification, degradation or
CC synthesis of mannan polysaccharides in vitro, particularly to treat
CC coffee beans to increase the percentage of dry matter extraction, and
CC thus reduce the quantity of sediment

XX
CC The invention provides modified nucleomonomers of specified formula and
CC their pharmaceutically acceptable salts. The nucleomonomers are used as
CC monomers in oligomers, which are used in pharmaceutical compositions to
CC inhibit expression of nucleic acid molecules including DNA and RNA in
CC cells such as bacterial, fungal, yeast, mammalian, cancer and virally-
CC infected cells. They are used in oligomers for gene regulation, antisense
CC technology, diagnostic applications to detect target sequences in
CC biological samples such as those containing pathogenic bacteria, fungi
CC and viruses, oncogenes, growth hormones and enzymes, to target genes or
CC encoded RNAs that encode enzymes, hormones, serum proteins, adhesion
CC molecules, receptor molecules, cytokines, oncogenes, growth factors and
CC interleukins associated with pathological conditions such as inflammatory
CC conditions, cardiovascular disorders, immune reactions, cancer, viral
CC infections and bacterial infections (see AAA07786 for details of other
CC uses for which the oligomers are suitable for). Oligomers comprising the
CC nucleomonomers exhibit increased duplex DNA stability when hybridizing to
CC target nucleic acid sequences, are physiologically stable, non-toxic and
CC able to penetrate into cells while maintaining stringent base pair
CC fidelity for target DNA sequences. The oligomers demonstrate significant
CC single- or double-stranded target nucleic acid binding activity to form
CC duplexes, triplexes or other forms of stable association. Sequences
CC AAA07788-803 represent oligonucleotides forming a third strand along with
CC the duplex sequences

CC The invention provides modified nucleomonomers of specified formula and

CC their pharmaceutically acceptable salts. The nucleomonomers are used as

CC monomers in oligomers, which are used in pharmaceutical compositions to

CC inhibit expression of nucleic acid molecules including DNA and RNA in

CC cells such as bacterial, fungal, yeast, mammalian, cancer and virally-

CC infected cells. They are used in oligomers for gene regulation, antisense

CC technology, diagnostic applications to detect target sequences in

CC biological samples such as those containing pathogenic bacteria, fungi

CC and viruses, oncogenes, growth hormones and enzymes, to target genes or

CC encoded RNAs that encode enzymes, hormones, serum proteins, adhesion

CC molecules, receptor molecules, cytokines, oncogenes, growth factors and

CC interleukins associated with pathological conditions such as inflammatory

CC conditions, cardiovascular disorders, immune reactions, cancer, viral

CC infections and bacterial infections (see AAA07786 for details of other

CC uses for which the oligomers are suitable for). Oligomers comprising the

CC nucleomonomers exhibit increased duplex DNA stability when hybridizing to

CC target nucleic acid sequences, are physiologically stable, non-toxic and

CC able to penetrate into cells while maintaining stringent base pair

CC fidelity for target DNA sequences. The oligomers demonstrate significant

CC single- or double-stranded target nucleic acid binding activity to form

CC duplexes, triplexes or other forms of stable association. Sequences

CC AAA07788-803 represent oligonucleotides forming a third strand along with

CC the duplex sequences

 PT New hybridization probe for specific triplex formation with large double
 PT helices, useful e.g. for site-specific diagnostic cleavage, contains
 PT attached functional residue.
 XX
 PS Example 1; Fig 3B; 20pp; English.
 XX
 CC This invention relates to hybridisation probes which target a specific
 CC sequence within a large double-helical nucleic acid. The probe is
 CC complementary to the target sequence and contains at least one nucleotide
 CC with an attached molecule that is able to cleave double-helical DNA e.g.
 CC EDTA-Fe(II) (ethylenediaminetetraacetic acid-iron complex). The probes
 CC where the attached molecule is a label or compound that alters gene
 CC expression, are used for specific detection and/or cleavage of double-
 CC helical DNA, e.g. for diagnosis, for treatment of disease (particularly
 CC caused by viruses, genetic defects or oncogenes), for chromosomal
 CC analysis, and for the isolation and mapping of genes. The present
 CC sequence represents probe of the invention used in an example
 CC illustrating how the probe binds to and cleaves double stranded DNA

PT Conjugate of oligonucleotide, minor groove binder and latent fluorophore,
 PT useful for detecting specific nucleic acids, e.g. for single-nucleotide
 PT mismatch discrimination.
 XX
 PS Disclosure; Page 58; 105pp; English.
 XX
 CC The present sequence is that of the oligonucleotide (ODN) component of an
 CC ODN-MGB (minor groove binder)-LF (latent fluorophore) conjugate of the
 CC invention. MGBs bind in a non-intercalating manner to the minor groove of
 CC non-single-stranded DNA, RNA or their hybrids, while a LF binds similarly
 CC but in an intercalating manner, or lies in the minor groove, or is
 CC oriented in some other way to the DNA molecule by MGB, such that it
 CC becomes fluorescent (or its fluorescent properties change detectably).
 CC The conjugates are used as hybridisation probes and amplification primers
 CC for fluorescent detection of specifically hybridising sequences, for
 CC analysis or diagnosis, especially (real-time) PCR, for single-nucleotide
 CC mismatch discrimination, target or signal amplification, array-based
 CC assays and sequencing, including detection of double-stranded DNA by
 CC triplex formation. Many different targets can be detected a single
 CC reaction vessel. The present ODN-MGB-LF conjugate was used to demonstrate
 CC hybridisation-triggered fluorescence. Upon hybridisation to the
 CC complementary target sequence there was an increase in fluorescence
 CC yield, measured as the ratio of the fluorescence emitted by the hybrid
 CC between the ODN-MGB-LF conjugate and its target sequence to the
 CC fluorescence emitted by unhybridised (i.e. single-stranded) ODN-MGB-LF,
 CC of 8.3

XX Intermediate for oligonucleotide synthesis comprises partially hydrolysed
PT cross-linked vinyl acetate copolymer loaded with nucleotide derivative.
XX
PS Example 2; Page 5; 8pp; German.
XX
CC This invention describes a novel chemical product comprising a partially
CC hydrolysed cross-linked vinyl acetate copolymer carrier material loaded
CC with nucleotide derivative(s). The product is an intermediate for the
CC large (gram) scale solid phase synthesis of modified oligonucleotides
CC useful e.g. as clinical diagnostics and therapeutics, e.g. for the
CC treatment of AIDS and cancers. The presence of the partially hydrolysed
CC copolymer facilitates the synthesis of larger amounts of oligonucleotides
CC compared with the use of Merckogel (RTM; macroporous polyvinyl acetate)
CC described in Nucleic Acid Res. Sympos. Ser. 31, p. 153, 1994.
CC Oligonucleotides are obtained in very good quality and high yields. Also,
CC the nucleosides do not display the reduced activity seen in some prior
CC art procedures, less carrier material, reagents and solvent are required.
CC Further, the carrier material is biodegradable and thus does not present
CC disposal problems. It also swells uniformly in a range of solvents, which
CC obviates expansion or contraction during use or solvent exchange.
CC AAH20510-AAH20513 represent oligonucleotides containing modified
CC deoxynucleotides which are used to illustrate the method of the invention

XX New DNA-peptide nucleic acid chimeras, useful e.g. as antisense agents
PT for treating e.g. cancer, also as diagnostic probes and primers.
XX
PS Example 26; Page 40; 54pp; German.
XX
CC This invention describes novel polyamide-oligonucleotide derivatives (I)
CC and their physiologically acceptable salts of formula F((DNA)-Li)q(PNA-
CC Li)r(DNA-Li)s(PNA)t where q, r, s, t = 0 or 1, with the sum of
CC two or more adjacent letters at least 2; x = 1-20; DNA = nucleic acid
CC (such as DNA or RNA or their known derivatives); Li = covalent linkage
CC between DNA and PNA, i.e. a bond or a residue containing at least one
CC atom of carbon, nitrogen, oxygen or sulfur; PNA = polyamide structure
CC containing at least one nucleobase different from thymine; and F, F' =
CC end groups and/or are connected through a covalent bond. The products of
CC the invention have anticancer, antiproliferative, antiviral, hepatotropic
CC and vasotropic activity and can be used for the inhibition of gene
CC expression by antisense, ribozyme, sense, or triple-helix methods, or by
CC binding to proteins (aptamers). (I) are used for treating diseases caused
CC by viruses (human immune deficiency, herpes simplex, influenza, vesicular
CC stomatitis, hepatitis B or papilloma), or mediated by integrins or cell-
CC cell adhesion reactions, for treating cancer, or for inhibiting
CC restenosis, particularly as antisense reagents. They are also useful in
CC heterogeneous or homogeneous assays, as primers or probes, particularly
CC where the target is amplified before being detected by hybridization, for
CC diagnosis of genetic, malignant or pathogen-related diseases. (I) retain
CC the increased affinity for complementary strands and better stability in
CC serum, associated with conventional peptide nucleic acids (PNA), but lack
CC the disadvantages, i.e. have improved cellular uptake, do not aggregate
CC in aqueous solution, and have reduced affinity for purification
CC materials, reduced cytotoxicity, better sequence specificity. They are
CC more active than either DNA or PNA oligomers. When used as probes, (I)
CC show different responses to base-pair mismatches in the DNA and PNA
CC segments, allowing better discrimination between pathogenic and non-
CC pathogenic conditions such as the transition from proto-oncogene to
CC oncogene, also, when used as primers, with the PNA segment at the 5'-end,
CC they produce amplicons resistant to 5'-exonuclease, allowing this enzyme
CC to be used to eliminate RNA or DNA primers. The DNA component allows
CC additional reactions not possible with PNA alone, e.g. 3'-tailing and (I)
CC may be incorporated into a gene. AAH49208-AAH49264 represent
CC oligonucleotides used to illustrate the method of the invention

PT Oligonucleotides analogs useful in detection, separation and purification

PT of nucleic acid molecules, comprise monomers, dimers and oligomers.
XX
PS Example 20; Page 123; 197pp; English.
XX
CC This invention relates to oligonucleotide analogues comprising a protein
CC nucleic acid molecule (PNA) monomer. They are used in the detection and
CC separation of nucleic acid molecules and as probes, primers, linkers,
CC adapters and antisense agents on solid supports. Modifications enhance
CC their use as capture and detection probes e.g. by the incorporation of
CC biotin, digoxigenin, radioisotopes, fluorescent labels such as
CC fluorescein and reporter molecules such as alkaline phosphatase. They are
CC also used for enhancing or inhibiting the activity of an enzyme or
CC cellular activity. The compounds are stable to nucleases and proteases,
CC have high affinity, binding specificity and solubility. The polyamide
CC backbone of PNAs is resistant to both nucleases and proteases. PNAs bind
CC nucleic acid molecules with greater affinity than DNA or RNA
CC concentration. The compounds are relatively simple to synthesize and are
CC used in a wide variety of applications. This sequence represents a DNA
CC oligomer which is used to represent the effect of single base mismatches

PT Detecting mutations in nucleic acid, useful for diagnosis and
PT characterization of tumors, by amplification, in vitro transcription and
PT translation, then protein detection.
XX

PS Claim 11; Fig 5; 62pp; German.

XX

CC The present invention relates to a method of detecting mutations in a

CC nucleic acid by amplifying the nucleic acid to produce a double-stranded

CC amplicon, in vitro transcription and translation of this amplicon, and

CC detection of the translated protein. The primers used for amplification

CC are designed to produce an amplicon that is translatable and allows

CC differentiation between translation products of wild-type and mutated

CC nucleic acids. The method is used to detect mutations in tumour

CC suppressor genes, for (early) diagnosis, monitoring and characterisation

CC of tumours (especially of bladder and intestines) and in the germ line

CC (using nucleic acids from embryos or blood cells). A new multi-tag vector

CC is used to detect or verify the reading frame of a nucleic acid cloned in

CC it, and to determine the suitability of detectable peptides for analysis

CC and/or purification of a recombinant protein, expressed from a sequence

CC cloned in the vector. The present sequence encodes a tag peptide and was

CC used in the invention

PS Example 5; Page 10; 30pp; English.

XX

CC The present invention relates to new human pre-adipose cell lines capable

CC to differentiate to white adipose cells, exhibiting essentially the same

CC cellular properties of normal white adipose cells. The human pre-adipose

CC cell lines are useful for the identification of substances controlling

CC the regulation of lipid uptake and release by human white adipocytes, and

CC substances controlling the differentiation of preadipocytes into mature

CC adipocytes. They are useful for screening compounds capable to regulate

CC the secretion of any metabolites or hormones from human white adipocytes.

CC Sequences of the invention are useful for developing drugs, food

CC ingredients and supplements against obesity, diabetes and cardio-

CC vascular diseases. The present DNA sequence is a reverse transcription

CC (RT)-PCR primer which is used for the expression of adipocytes in
CC differentiated immortalised human preadipose cells. This primer is used
CC in the exemplification of the invention

PT Derivatized antisense oligoribonucleotide useful to inhibit e.g. viral
PT reverse transcriptase comprises at the 2'-O position of the
PT oligoribonucleotide, a hydrophobic carrier reagent containing a poly
PT substituted phenyl compound.
XX
PS Example 3; Col 24; 56pp; English.
XX
CC The invention relates to derivatised antisense oligoribonucleotides with
CC enhanced membrane permeability and stability. The derivatised antisense
CC oligoribonucleotide complementary to a sequence of nucleotides found in a
CC virus or a cell is useful for inhibiting e.g., viral reverse
CC transcriptase. Derivatized antisense oligoribonucleotide is conjugated at
CC the 2'-O position with a hydrophobic carrier reagent containing a poly
CC substituted phenyl compound. The derivatised oligoribonucleotides are
CC used to decrease the expression of oncogenes and thereby decrease the
CC expression of cancer cells which rely upon oncogene expression for their
CC phenotypic and pathological properties. The oligoribonucleotides are also
CC used for increasing the effectiveness of antisense oligonucleotide
CC targetted to a gene associated with a disease or a condition in an
CC animal. To alter gene transcription and/or translation for any gene or
CC gene segment responsible for expression, to inhibit viral reverse
CC transcriptase, to inhibit the expression of leukaemia virus, hepatitis

CC virus, oncogenes and human immunodeficiency virus. The present sequence
CC is retroviral reverse transcriptase inhibitor DNP-poly [A] RNA fragment
CC which is used in the treatment of moloney murine leukaemia virus (MuLV)
CC in mammals. (Updated on 07-AUG-2003 to correct OS field.) (Updated on 29-

PT New vectors comprising operably linked DNA fragments having an origin of
PT replication, a selectable marker and a chimeric DNA construct, useful for
PT silencing target nucleic acids and for producing large amounts of double-
PT stranded RNA.
XX
PS Claim 14; Page 74; 104pp; English.
XX
CC The present invention describes a vector (I) comprising operably linked
CC DNA fragments having: (a) origin of replication allowing replication in a
CC recipient cell, preferably in bacteria such as Escherichia coli; (b)
CC selectable marker region capable of being expressed in the recipient cell
CC ; and (c) a chimeric DNA construct comprising: (i) promoter or promoter
CC region capable of being recognized by RNA polymerases of a eukaryotic
CC cell or by prokaryotic RNA polymerase; (ii) first, second, third and
CC fourth recombination sites; (iii) 3' transcription terminating and
CC polyadenylation region functional in the eukaryotic cell. The first and
CC fourth recombination sites, or the second and third recombination sites
CC are capable of reacting with a same recombination site, and preferably
CC are identical. The first and second recombination sites, or the third and
CC fourth recombination sites, do not recombine with each other or with a
CC same recombination site. The vector is useful for producing large amounts
CC of double-stranded RNA which can be used for silencing target nucleic
CC acid sequences. The vectors can also be used to convert a DNA fragment
CC into an inverted repeat structure. Plants transformed with a vector from
CC the present invention can be used in a conventional breeding scheme to
CC produce more plants with the same characteristics or to introduce a

CC chimeric gene for reduction of the phenotypic expression of nucleic
CC acids. The present sequence represents an acceptor vector nucleotide
CC sequence from the present invention

PT New ribozymes targeting RNA derived from hepatitis C virus inhibit viral
PT replication and are useful to treat hepatitis C virus infections and
PT cirrhosis, liver failure or hepatocellular carcinoma.
XX
PS Claim 1; Page 21; 80pp; English.
XX
CC The present invention relates to enzymatic nucleic acids which
CC specifically cleave RNA derived from Hepatitis C virus (HCV). The
CC enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin
CC (HP) motif where the binding arms comprise sequences complementary to one
CC of the substrate sequences defined in the specification. The HCV
CC ribozymes are useful for modulating the expression and/or replication of
CC HCV. They can be used to treat cirrhosis, liver failure and/or
CC hepatocellular carcinoma. The HCV ribozymes are also useful for treating
CC a condition associated with HCV infection in conjunction with one or more
CC other drug therapies, particularly type I interferon, especially
CC interferon alpha, beta or gamma or consensus interferon. The present
CC sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note:
CC Some of the sequence data for this patent did not form part of the
CC printed specification. The complete sequence data for this patent was
CC obtained in electronic format directly from the USPTO web site at

PT New ribozymes targeting RNA derived from hepatitis C virus inhibit viral
PT replication and are useful to treat hepatitis C virus infections and
PT cirrhosis, liver failure or hepatocellular carcinoma.
XX
PS Claim 1; Page 64; 80pp; English.
XX
CC The present invention relates to enzymatic nucleic acids which
CC specifically cleave RNA derived from Hepatitis C virus (HCV). The
CC enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin
CC (HP) motif where the binding arms comprise sequences complementary to one
CC of the substrate sequences defined in the specification. The HCV
CC ribozymes are useful for modulating the expression and/or replication of
CC HCV. They can be used to treat cirrhosis, liver failure and/or
CC hepatocellular carcinoma. The HCV ribozymes are also useful for treating
CC a condition associated with HCV infection in conjunction with one or more
CC other drug therapies, particularly type I interferon, especially
CC interferon alpha, beta or gamma or consensus interferon. The present
CC sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note:
CC Some of the sequence data for this patent did not form part of the
CC printed specification. The complete sequence data for this patent was
CC obtained in electronic format directly from the USPTO web site at
CC seqdata.uspto.gov/psipsDIDEntry.html

XX PT Compound for binding macromolecule to substrate surface or conjugation targets, contains phosphorous containing reactive group, hydrazide protecting group and benzene ring, and has predefined formula.
XX PS Example 4; Page 44; 120pp; English.
XX CC The present sequence is of a hydrazine treated hydrazide precursor phosphoramidite 15-mer, designated oligo O35, which was produced in an example from the invention and which includes a synthetic branching amide compound. The invention describes an improved process for immobilisation of macromolecules including DNA, RNA, peptide nucleic acids, pyranosyl-RNA and peptides, especially macromolecules containing multiple reactive sites, to a substrate surface or other conjugation target. It also describes the preparation of oligos containing one or more hydrazides, which can be used for conjugation to surface binding moieties, or for other conjugation reactions. The process is useful e.g. in nucleic acid hybridisation based assays, DNA chip technology and biosensor applications

PT A triple-helix comprising a double helical nucleic acid (DHNA) and an
PT oligonucleotide which binds in parallel and antiparallel orientation,
PT respectively, for targetting sequences on alternate strands of DHNA to
PT control gene expression.
XX

PS Example 1; Fig 3B; 108pp; English.
XX

CC The present invention relates to methods and oligonucleotides for forming
CC a triple-helix comprising a double helical nucleic acid comprising first
CC and second substantially complementary strands, and an oligonucleotide
CC bound to a purine-rich target sequence within the double helical nucleic
CC acid, where the oligonucleotide binds in a parallel and antiparallel
CC orientation, respectively, to target sequences on alternate strands of
CC the double helical nucleic acid. The method has therapeutic applications,
CC within gene expression is controlled by selective triple-helix formation
CC oligonucleotides comprising sequences of a target gene. The
CC detect the presence or absence of specific sequences within genomic DNA
CC for diagnostic and therapeutic purposes. The oligonucleotides can be
CC selected to specifically bind to pathogenic double-stranded DNA including
CC specific sequences required by pathogenic bacteria or viruses for
CC replication or virulence, reducing their pathogenicity. Alternatively,
CC the oligonucleotide can be chosen to target a unique sequence of the
CC pathogen which is not found in the genome of pathogen's host. The
CC oligonucleotides can be used in cancer treatment by way of triple-helix
CC suppression of specific oncogenes including those of endogenous or viral
CC origin. Such therapeutic oligonucleotides are capable of forming triple-
CC helices with such sequences in cancerous cells containing the activated
CC oncogene, so preferentially killing or repressing the cancer causing
CC cell. The present sequence represents an oligonucleotide used in the
CC methods of the present invention

PT A triple-helix comprising a double helical nucleic acid (DHNA) and an
PT oligonucleotide which binds in parallel and antiparallel orientation,
PT respectively, for targetting sequences on alternate strands of DHNA to
PT control gene expression.
XX

PS Example 7; Fig 24A; 108pp; English.
XX

CC The present invention relates to methods and oligonucleotides for forming
CC a triple-helix comprising a double helical nucleic acid comprising first
CC and second substantially complementary strands, and an oligonucleotide
CC bound to a purine-rich target sequence within the double helical nucleic
CC acid, where the oligonucleotide binds in a parallel and antiparallel
CC orientation, respectively, to target sequences on alternate strands of
CC the double helical nucleic acid. The method has therapeutic applications,
CC where gene expression is controlled by selective triple-helix formation
CC within gene expression regulatory sequences of a target gene. The
CC oligonucleotides can be used to form triple-helices, and are useful to
CC detect the presence or absence of specific sequences within genomic DNA
CC for diagnostic and therapeutic purposes. The oligonucleotides can be
CC selected to specifically bind to pathogenic double-stranded DNA including
CC specific sequences required by pathogenic bacteria or viruses for
CC replication or virulence, reducing their pathogenicity. Alternatively,
CC the oligonucleotide can be chosen to target a unique sequence of the
CC pathogen which is not found in the genome of pathogen's host. The
CC oligonucleotides can be used in cancer treatment by way of triple-helix
CC suppression of specific oncogenes including those of endogenous or viral
CC origin. Such therapeutic oligonucleotides are capable of forming triple-
CC helices with such sequences in cancerous cells containing the activated
CC oncogene, so preferentially killing or repressing the cancer causing
CC cell. The present sequence represents an oligonucleotide used in the
CC methods of the present invention

PT	nucleic acid library.								
XX	PS	Disclosure; Fig 5; 83pp; English.							
XX	CC	The present sequence is that of a poly-T oligonucleotide used in a method							
CC	designed to rapidly array and normalize a complex cDNA library obtained								
CC	from a target species. Clones are arrayed into multi-well plates. Each								
CC	well contains 16 oligonucleotides with a 5' polylinker, a poly-T run								
CC	capable of binding cDNAs by their poly-A tail and a unique 3' sequence,								
CC	which allows an anchored oligonucleotide in each well to selectively								
CC	hybridise only to those cDNA clones with a complementary 5' end. The								
CC	unique 3' key sequences are designed to give a comprehensive level of								
CC	degeneracy since they are diverse and numerous enough to ensure that								
CC	every possible cDNA sequence can be bound by an individual, specific								
CC	oligonucleotide in a single well. The cDNA library is heated to denature								
CC	the clones into single stranded DNA, and an aliquot is added to every								
CC	well. The anchored oligonucleotide serves as the 3' primer in PCR, and								
CC	the common 5' region present in every cDNA clone serves as the 5' priming								
CC	site. Denaturing and washing leave anchored cDNA in each well. The								
CC	library is now arrayed and normalised. The method was used to identify								
CC	and isolate clones encoding G-protein coupled receptors, especially								
CC	odourant receptors, and active effectors involved in the olfactory								
CC	pathway of invertebrates and vertebrates, e.g. odourant binding proteins,								
CC	or other olfactory or neuronal proteins. The identified receptors and								
CC	proteins are useful for identifying compounds that reduce a target								
CC	animal's sensitivity to odours, for manufacturing compounds or devices								
CC	that mask odours, or trapping invertebrates with odourants

PT New oligonucleotide deprotection reagent useful for deprotecting
PT oligonucleotide comprises an active methylene compound and an amine
PT reagent.
XX
PS Example 2; Page 25; 46pp; English.
XX
CC The present invention provides a method for deprotection of an
CC oligonucleotide. This involves reacting a protected oligonucleotide,
CC which is preferably covalently attached to a solid support through a
CC linkage, with a deprotection reagent comprising an active methylene
CC compound and an amine reagent. The process and reagent minimise side-
CC reactions leading to certain impurities that contaminate synthetic
CC oligonucleotides. The present sequence is a T15 phosphoramidite
CC oligonucleotide having a quencher moiety (Q) and minor groove binder
CC (CDPI3) at the 3' end, which was synthesised in an example of the
CC invention. This protected oligonucleotide was treated either with 15%
CC ethanolic ammonia or with 3% diethylmalonate (DEM) dissolved in 15%
CC ethanolic ammonia for 2 hours at 55 degrees C. HPLC analysis showed that

CC deprotection without DEM yielded a complex mixture of products containing
CC only 26.5% of the desired product. When DEM was used, 76.8% of the
CC desired product was obtained

PT Hairpin sensor useful for detecting a target nucleotide sequence in a
PT sample, comprises a hairpin loop assembly including a complementary probe
PT and a quenchable fluorescing agent.
XX
PS Example 2; Page 11; 16pp; English.
XX
CC The invention discloses a hairpin sensor comprising a hairpin loop
CC assembly including a complementary probe positioned between a first
CC inverse repeat arm and a second inverse repeat arm, and a quenchable
CC fluorescing agent joined, directly or indirectly, to the end of the
CC second inverse repeat arm of the hairpin loop assembly opposite the
CC complementary probe. Also claimed is a microarray comprising the hairpin
CC sensor, where the end of the first inverse repeat arm opposite the
CC complementary probe is bound, directly or indirectly, to a support, a kit
CC for detecting a target nucleotide sequence in a sample comprising the
CC hairpin sensor, and a support, and a hairpin sensor system, in which the
CC particle is conductive or semi-conductive, including at least one of the
CC above hairpin sensor assemblies. The hairpin sensor further comprises a
CC functional group joined to the end of the first inverse repeat arm

CC opposite the complementary probe, or first spacer opposite the first
CC inverse repeat arm, the functional group selected from amino, carboxyl,
CC thiol and hydroxyl. Further, the sensor comprises a ligand positioned
CC between the second inverse repeat arm and the quenchable fluorescing
CC agent, where the ligand is selected from mercapto, hydroxyl, amino,
CC nitrile and carboxyl, carboxylic acid, organic acid and amino acid. The
CC second spacer is positioned between the second inverse repeat arm and the
CC quenchable fluorescing agent which comprises a semiconductor nanocrystal
CC or rhodamine B-labelled dye. Within the microarray the support is capable
CC of accepting a charge. At least one hairpin sensor comprises two or more
CC hairpin sensors. The two or more hairpin sensors include complementary
CC probes that are the same or different and respective quenchable
CC fluorescing agents that are the same or different. The two or more
CC hairpin sensors are arranged in a spatially-defined pattern. The sensor
CC and system are useful for detecting a target nucleotide sequence in a
CC sample. Further, the method involves identifying the target nucleotide
CC sequence by the location of the complementary probe to which the target
CC nucleotide sequence binds. The two or more hairpin sensors include
CC complementary probes or quenchable fluorescing agents, that are
CC different. The sequence presented is the hairpin oligonucleotide target
CC sequence, #1, used in an example of the invention.

PT Annealing control primer to improve annealing specificity in nucleic acid
PT amplification, has region complementary to target, arbitrary nucleotide
PT sequence, regulator with universal base/non-discriminatory base analog.

XX Example 2; SEQ ID NO 54; 190pp; English.

XX
CC The present invention describes an annealing control primer (ACP) (I) for
CC improving the annealing specificity in nucleic acid amplification. (I)
CC has a 3'-end portion with a nucleotide sequence complementary to a site
CC on a template nucleic acid for hybridisation, a 5'-end portion having a
CC pre-selected arbitrary nucleotide sequence, and a regulator portion
CC between the 3' and 5'-end portions, comprising a universal or non-
CC discriminatory base analogue, where the regulator portion is capable of
CC regulating an annealing portion of the primer in association with
CC annealing temperature. (I) is useful for improving annealing specificity
CC in nucleic acid amplification. (I) is useful for amplifying a nucleic
CC acid sequence from a DNA or a mixture of nucleic acids, for selectively
CC amplifying a target nucleic acid sequence from a DNA, and for selectively

CC amplifying a target nucleic acid sequence from a mRNA, by reverse
CC transcribing the mRNA and performing an amplification reaction using (I).
CC (I) is also useful for detecting DNA complementary to differentially
CC expressed mRNA in two or more nucleic acid samples, by reverse
CC transcribing the mRNA and performing an amplification reaction using (I).
CC (I) is also useful for rapidly amplifying a target cDNA fragment
CC comprising a cDNA region corresponding to the 3'-end or 5'-end region of
CC an mRNA, for amplifying a population of full-length double-stranded cDNAs
CC complementary to mRNAs, and amplifying 5'-enriched double-stranded cDNAs
CC complementary to mRNA. (I) is also useful for amplifying more than one
CC target nucleotide sequence simultaneously using more than one pair of
CC primers in the same reaction, where the primers are derived from (I), for
CC producing a DNA fingerprint of genomic DNA (gDNA), for producing a RNA
CC fingerprint of an mRNA sample, identifying conserved homology segments in
CC a multigene family from an mRNA sample, and for identifying conserved
CC homology segments in a multigene family from gDNA. (I) is also useful for
CC identifying a nucleotide variation in a target nucleic acid, and for
CC mutagenesis in a target nucleic acid. The present sequence represents a
CC primer which is used in the exemplification of the present invention.

PT Recombinant jungle red fowl (Gallus gallus) heparanase protein, useful
PT for treating cancers, microbial infections and aiding wound healing.
XX

PS Example; Page 13; Opp; English.

XX The present invention relates to novel jungle red fowl heparanase protein
CC and polynucleotides encoding such proteins. Heparanase sequences can be
CC used to develop treatments for various diseases, to develop diagnostic
CC assays for these diseases and to provide new tools for basic and directed
CC research especially in the fields of medicine and biology. They can be
CC used to develop new drugs to inhibit tumour cell metastasis, inflammation
CC and autoimmunity. Recombinant heparanase offers a potential treatment for
CC wound healing, angiogenesis, restenosis, atherosclerosis, inflammation,
CC neurodegenerative diseases (e.g. Genstmann-Straussler Syndrome, Scrapie,
CC Creutzfeldt-Jakob disease and Alzheimer's disease) and certain viral and
CC some bacterial and protozoa infections. Recombinant heparanase can also
CC be used to neutralise plasma heparin, as a potential replacement of
CC protamine. Sequences of the invention are used in protein therapy. The
CC present sequence is chicken heparanase DNA specific PCR primer used in
CC the exemplification of the invention

PT splicing.

XX

XX Disclosure; Fig R; 114pp; German.

PS

XX

CC This invention describes a novel method of repairing a mutated exon (mE)

CC in the pre-mRNA of a mammalian cell. The method comprises introducing

CC into the cell a DNA (I) that encodes repair RNA (II) in the form of a pre

CC -mRNA (III) comprises a non-mutated exon (nmE) with at least one flanking

CC outtron so that mE is exchanged for nmE, via RNA trans-splicing, using

CC splice components naturally present in the cell. The invention also

CC discloses DNA, encoding trans-splicing RNA that comprises an origin of

CC replication, an RNA polymerase-II promoter and a 3'-terminal signal for

CC polyadenylation of pre-mRNA, selective killing of tumour cells in a cell

CC population, identifying potential trans-splicing sites in cellular pre-

CC mRNA and subsequent identification of natural, cellular trans-spliced RNA

CC and identifying trans-splicing sites in cellular mRNA. The nucleic acid

CC of the invention produces a repair RNA containing a 5'-outtron and/or 3'-

CC outtron with at least 10 nucleotides (nt). Each outtron has at least one

CC antisense sequence that pairs, in antisense, over a length of at least 18

CC bases to mE and/or to an intron region that flanks mE. Especially the

CC antisense part of the 5'-outtron pairs to the intronic polypyrimidine

CC sequence of a 3'-splice site in mE, while that of the 3'-outtron pairs to

CC the intronic sequence of a 5'-splice site. Especially the 5'-outtron

CC comprises a branch-A site, a polypyrimidine stretch and an AG

CC dinucleotide at the border of the repair exon, while the 3'-outtron

CC includes a GU dinucleotide at the border of this exon. The repair exon

CC comprises, apart from the wild-type sequence, a 3-mer, 3'-sequence as

CC exonic splice site, provided that the exon follows an outtron, optionally

CC also an exonic splice enhancer site which does not introduce

CC additional/alterd amino acids. Alternatively, the nucleic acid encodes a

CC truncated cell-death pre-mRNA that includes a frame shift sequence (up to

CC nt) at the 5'-end, also a recognition site for a cellular protease; it

CC then has a 5'-outtron that hybridises to specific tumour cell pre-mRNA or

CC it is a probe pre-mRNA of 150-250 nt, if no protein-encoding sequences

CC are present in the exon, or several hundred nt if such sequences are

CC present. It also includes a single 5' - or 3'-splice site and,

CC accordingly, an exon or outtron, where the outtron includes a sequence of

CC 12-18 uracils and an 8-12-mer recognition/cleavage site for a restriction

CC enzyme. The trans-spliced RNA is amplified by cDNA-PCR (polymerase chain

CC reaction), and the products sequenced in the region that represents the

CC unknown cellular RNA. Further PCR analysis is performed using primers

CC that hybridise to two, predetermined, previously sequenced, exonic

CC fragments of the two trans-spliced RNAs. Natural cellular trans-spliced

CC RNAs are identified by PCR analysis if two specific trans-spliceable

CC cellular RNAs form, in vivo , a detectable trans-spliced hybrid. The

CC primers used for analysis hybridise to previously sequenced exonic

CC fragments from the trans-spliced RNA probes. The method is used for

CC selective killing of tumour cells and for identifying potential trans-

CC splicing sites in cellular pre-mRNAs and subsequently, natural, cellular

CC trans-spliced mRNAs. The method can correct genetic defects that cause

CC disease.

PT Cleaving single-stranded nucleic acid sequences at a desired location by
PT contacting the nucleic acid with an single strand oligonucleotide
PT complementary to a nucleic acid region where cleavage is desired.
XX
PS Disclosure; Page 481; 485pp; English.
XX
CC The present invention describes a method for cleaving single-stranded
CC nucleic acid sequences at a desired location. Also described: (1) methods
CC for displaying or expressing a member of a diverse family of peptides,
CC polypeptides or proteins on the surface of a genetic package and
CC collectively displaying at least a part of the diversity of the family,
CC where the displayed or expressed peptide, polypeptide or protein is
CC encoded at least in part by a nucleic acid that has been cleaved at a
CC desired location; (2) a method for preparing single-stranded nucleic
CC acids; (3) a method for preparing a library comprising a collection of
CC genetic packages that display a member of a diverse family of peptides,
CC polypeptides or proteins and that collectively display at least a portion
CC of the family; (4) a vector comprising a DNA sequence encoding an
CC antibody variable region linked to a version of PIII anchor which does
CC not mediate infection of phage particles, and wild-type gene III; (5) a
CC method for producing a population or a library of immunoglobulin genes;

CC and (6) a library of immunoglobulins that comprise members having at
CC least one variable domain in which at least one of CDR1 and CDR2 contain
CC synthetic diversity and CDR3 diversity is captured from B cells. The
CC method is useful for cleaving single-stranded nucleic acid sequences at a
CC desired location, which can be subsequently used to produce libraries or
CC genetic packages that display and/or express a diverse family of
CC peptides, polypeptides or proteins. ABZ36912 to ABZ37510 and ABP55464 to
CC ABP55499 represent sequences used in the exemplification of the present
CC invention

XX New annealing control primer capable of improving primer annealing
PT specificity in association with the alteration of primer annealing
PT temperature, useful for selectively amplifying a target nucleic acid
PT sequence.
XX
PS Example 2; SEQ ID NO 54; 137pp; English.
XX
CC The invention relates to a novel annealing control primer (ACP) capable
CC of improving primer annealing specificity in association with the
CC alteration of primer annealing temperature comprising 3' and 5'-end
CC portions separated by at least 2 deoxyinosine residues, universal bases
CC or non-discriminatory base analogues. The annealing control primer of the
CC invention may be useful for selectively amplifying a target nucleic acid
CC sequence from a nucleic acid molecule or mixture of nucleic acids, for
CC detecting DNA complementary to differentially expressed mRNA in two or
CC more nucleic acid samples or for amplifying a population of full-length
CC double-stranded cDNAs complementary to mRNAs using annealing control
CC primers. The current sequence is that of the annealing control primer of
CC the invention which was used to amplify a murine sequence.

PT	Amplifying for RNA in a sample, useful for improving RNA polymerase based
PT	RNA transcription from a polynucleotide template, comprises eliminating
PT	single-stranded oligonucleotide from the transcription sample.

XX PS Example 1; SEQ ID NO 5; 26pp; English.

XX CC The invention relates to amplifying for RNA in a sample comprises

CC eliminating single-stranded oligonucleotide from the transcription

CC sample. The method involves synthesizing single-stranded cDNA by

CC incubating the sample RNA with reverse transcriptase and an

CC oligonucleotide primer that primes synthesis in a direction toward 5' end

CC of the RNA; converting the single-stranded cDNA into double-stranded cDNA

CC to form a transcription sample containing a cDNA template; eliminating

CC single-stranded oligonucleotide from the transcription sample; and

CC transcribing the cDNA template into RNA using an RNA polymerase. The

CC method is useful for improving RNA polymerase based RNA transcription

CC from a polynucleotide template. The method inhibits the undesired non-

CC template derived production of RNA in the transcription reaction.

CC Sequences ADI34483-ADI34489 represent oligonucleotides used in a T7 RNA

CC transcription reaction.

XX New antisense oligonucleotide hybridizable with a polynucleotide encoding

PT a polypeptide with heparanase activity, useful for treating diseases such

PT as cancer and autoimmune disorders.

XX Example; SEQ ID NO 5; 108pp; English.

XX The invention relates to an antisense oligonucleotide (ASO) comprising a

CC polynucleotide or a polynucleotide analogue of at least 10 bases being

CC hybridisable in vivo , under physiological conditions, with a portion of

CC a polynucleotide strand encoding a polypeptide having heparanase

CC catalytic activity. Also included are a method of in vivo downregulating

CC heparanase activity (comprising administering the ASO in vivo), a method

CC of treating a subject suffering from a pathological condition

CC (characterised by heparanase activity, comprising administering ASO to

CC the subject), a pharmaceutical composition comprising the ASO and a

CC carrier, an antisense nucleic acid construct (comprising a promoter

CC sequence and a polynucleotide sequence directing the synthesis of an

CC antisense RNA sequence of at least 10 bases being hybridisable in vivo ,

CC under physiological conditions, with a polynucleotide strand encoding a

CC polypeptide having heparanase catalytic activity), a method of in vivo

CC downregulating heparanase activity (comprising administering in vivo the

CC antisense nucleic acid construct), a pharmaceutical composition

CC comprising the antisense nucleic acid construct and a carrier, and an

CC antisense oligonucleotide comprising a polynucleotide or a polynucleotide

CC analogue of at least 10 bases being hybridisable in vivo , under

CC physiological conditions, with a portion of a polynucleotide strand being

CC characterised by forming at least a portion of an untranslated region

CC (UTR) for a polynucleotide strand encoding a polypeptide having

CC heparanase catalytic activity. The methods and compositions of the

CC present invention are useful for the prevention and/or treatment of

CC diseases or conditions associated with aberrant heparanase activity, such

CC as heparanase-dependent cancer, cancer, autoimmune reaction and

CC inflammation. The present sequence is a PCR primer used in the isolation

CC of human heparanase cDNA.

XX New transgenic non-human animal expressing heparinase, useful as models
PT for human disease, such as cancers, viral infection, neurodegenerative
PT diseases, restenosis, atherosclerosis and pulmonary disorders.
XX
PS Example; SEQ ID NO 5; 106pp; English.
XX
CC The present invention relates to a transgenic non-human animal whose
CC genome comprises an exogenous polynucleotide sequence, including a
CC promoter active in tissues of the non-human, a region encoding a human
CC heparanase, where the promoter and the region encoding human heparanase
CC are operably linked in the exogenous polynucleotide such that human
CC heparanase is expressed in at least a portion of the cells of the non-
CC human animal. The methods and compositions of the present invention are
CC useful for the production of transgenic animals expressing heparanase, to
CC be used as models for human diseases such as cancers, viral infection,
CC restenosis, neurodegenerative diseases, atherosclerosis and pulmonary
CC disorders. The present sequence is human hp3 DNA amplifying (reverse
CC transcription) RT-PCR primer used in the exemplification of the
CC invention.

PT Typing genes that contain polymorphic microsatellite loci, useful for
PT identifying predisposition to disease, by amplification and determining
PT length of amplicons.

XX Example 3; Page 31; 64pp; German.

PS The invention describes a method of typing (M1) a gene (I) that has one

XX or more polymorphic microsatellite loci (PML). The method comprises: PCR

CC amplification of at least one DNA region of (I) that includes PML, using

CC as template a DNA sample containing at least one segment of (I); and

CC determining the length of the resulting amplicon(s). Also described are:

CC a method of determining (M2) microsatellite markers (MM) for

CC predisposition to a disease, associated with a gene that includes one or

CC more PML; and prediagnosis (M3) of diseases associated with gene that

CC include PML. The method is used to identify microsatellite markers, in a

CC disease-related gene, that are associated with a predisposition to

CC diseases and for prediagnosis of such diseases, especially prion diseases

CC but also cystic fibrosis, malignant hyperthermia syndrome in pigs and

CC metabolic diseases; also to type genes that encode milk proteins,

CC hormones or transcription factors. The method is simpler, quicker and

CC particularly less expensive than known methods based on sequencing. This

CC sequence represents a primer used to genotype a region of the sheep prion

XX protein (PrP) comprising a polymorphic microsatellite locus.

PS Example 17; Page 148; 240pp; English.
XX
CC The invention relates to a novel method of inhibiting the expression of
CC one or more genes or RNA transcripts by administering at least one
CC oligonucleotide analogue that includes at least one hydroxyproline
CC nucleic acid (HypNA) monomer to a cell or organism or their extracts. Thr
CC oligonucleotides of the invention may be used to monitor properties
CC including gene expression, respiration, secretion, signalling, ion-
CC channel activity, cell motility, developmental phenotype and tumour
CC regression. Furthermore, they may be utilised to determine the effects of
CC particular genes, as antisense or homologous recombination constructs
CC e.g. for creating animal models of disease and finally, for increasing
CC the activity of some enzymes, such as polymerases. The current sequence
CC is that of the PNA-HypNA hybridisation oligomer of the invention. This
CC sequence may also comprise phosphono-PNA (pPNA) and serine nucleic acid
CC (SerNA) components.

CC The present invention describes a process for the preparation of a
CC nucleic acid sample comprising: (a) providing a nucleic acid sample
CC having a plurality of species of sequences, and providing one or a
CC plurality of kinds of probes having a known sequence substantially
CC complementary to a portion of sequence of the nucleic acid sample; (b)
CC mixing and hybridizing the nucleic acid sample with probes; (c)
CC subsequently recovering nucleic acid molecules; or (i) providing a
CC nucleic acid sample having a plurality of species of sequences, and
CC providing one or a plurality of kinds of probes having a known sequence

CC substantially complementary to a portion of sequence of the nucleic acid
CC sample; (ii) mixing and hybridizing the nucleic acid sample with the
CC probes; (iii) treating the product of (ii) with nuclease activity of an
CC enzyme or the probe itself; and (iv) subsequently recovering the nucleic
CC acid molecules not digested by the nuclease activity in (iii); or (I)
CC providing a nucleic acid sample having a plurality of species of
CC sequences and oligonucleotides primer having predetermined sequences for
CC synthesizing DNA strands; (II) providing one or a plurality of kinds of
CC probes having a known sequence substantially complementary to a portion
CC of a sequence of the nucleic acid sample having such a structure to
CC prevent a polymerase reaction from its 3' end and a nuclease reaction
CC from its 5' end; (III) mixing and hybridizing the nucleic acid sample
CC with the primers and probes; (IV) executing polymerase chain reaction for
CC the samples prepared in (III); and (V) subsequently recovering nucleic
CC acid molecules synthesized in (IV). The method is useful for the
CC preparation of a nucleic acid sample for the analysis of rare expressed
CC genes. The present sequence represents a PCR primer used in the
CC exemplification of the present invention

CC AAZ36739-41 represent oligo(dT) primers used for modified differential
CC display, in the method of the invention. The specification describes a
CC method for measuring the level of two or more nucleic acid molecules in a
CC target. The method comprises contacting a probe with an arbitrarily or
CC statistically sampled target and detecting the amount of specific binding
CC of the target to the probe. The methods can be used to identify
CC differentially expressed nucleic acid molecules associated with disease
CC states, such as cancer, autoimmune disease, infectious disease, aging,
CC developmental disorder, proliferative disorder or neurological disorder.
CC Alternatively the methods can be used to assess the efficacy or toxicity
CC of or a resistance to a treatment. Also the methods can be used to
CC determine differential expression of nucleic acid molecules in response
CC to a stimulus, e.g. a chemical, drug or growth factor (especially
CC epidermal growth factor), radiation, stress or a pathogen. The methods
CC can also be used to determine co-regulated genes that can be potential
CC targets for drug discovery

PT New nucleic acids that interact, and optionally cleave, target sequences,
PT used to treat cancer.
XX
PS Claim 77; Page 79; 148pp; English.
XX
CC The present invention describes nucleic acids (A) that interact stably
CC with a target sequence and contain at least one phosphoro(di)thioate
CC link, having endonuclease activity. (A), and more generally any catalytic
CC nucleic acid (A') that modulates expression of the oestrogen receptor
CC gene, are used to treat cancer (particularly of breast or endometrium),
CC in vivo or by transforming cells ex vivo and implanting treated cells, or
CC for other conditions associated with levels of oestrogen receptor.
CC Because of the high selectivity for targeted RNA, (A) can also be used to
CC correlate inhibition of gene expression with alterations in phenotype,
CC particularly for identification of therapeutic targets, and as research
CC reagents (for RNA, in the same way that restriction endonucleases are
CC used with DNA). The combination of modifications in (A) improves
CC resistance to nucleases, binding affinity and/or activity. AAA23503 to
CC AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and
CC AAA24748 to AAA25992 represent their corresponding target sequences.
CC AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme
CC sequences, and AAA26107 to AAA26218 represent their corresponding target
CC sequences. AAA26219 to AAA26271 represent other ribozyme sequences and
CC antisense oligonucleotides used in the exemplification of the present
CC invention

XX
PS Example 6; Page 69; 80pp; Japanese.
XX
CC The invention relates to the human pollinosis-associated gene 373 which
CC exhibits significantly reduced expression in the T-cells of individuals
CC with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene
CC was isolated from T-cells from individuals allergic to cedar pollen using
CC the differential display method. The invention also relates also relates
CC to the protein encoded by pollinosis gene 373; expression constructs and
CC host cells comprising pollinosis-associated gene 373 nucleic acids;
CC pollinosis-associated gene 373 primers and probes; antibodies against the
CC protein encoded by the gene; methods of detection of pollinosis-
CC associated gene 373 nucleic acids; and a method of diagnosis of allergic
CC diseases via the detection of pollinosis-associated gene 373 nucleic
CC acids. The invention additionally encompasses methods of screening drug
CC candidates for the treatment of allergic disease by measuring the
CC expression of pollinosis-associated gene 373 in pollen antigen-stimulated
CC T-cells in the presence of a test compound relative to a control.
CC Pollinosis-associated gene 373 is useful in the diagnosis of allergic
CC diseases and in the screening of drug candidates for the treatment of
CC such diseases. The present sequence represents a PCR primer used in the
CC isolation of human pollinosis-associated gene 373 cDNA

PT Pollinosis-associated gene 513 undergoing significantly low expression in
PT subjects with high cedar pollen-specific IgE levels, useful in diagnosis
PT of allergic diseases and screening drug candidates.

PS Example 6; Page 39; 46pp; Japanese.

XX
CC The invention relates to the human pollinosis-associated gene 513 which
CC exhibits significantly reduced expression in the T-cells of individuals
CC with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene
CC was isolated from T-cells from individuals allergic to cedar pollen using
CC the differential display method. The invention also relates to methods of
CC detection of pollinosis-associated gene 513 nucleic acids; a method of
CC diagnosis of allergic diseases via the detection of pollinosis-associated
CC gene 513 nucleic acids; and methods of screening drug candidates for the
CC treatment of allergic disease by measuring the expression of pollinosis-
CC associated gene 513 in pollen antigen-stimulated T-cells in the presence
CC of a test compound relative to a control. Pollinosis-associated gene 513
CC is useful in the diagnosis of allergic diseases and in the screening of
CC drug candidates for the treatment of such diseases. The present sequence
CC represents a PCR primer used in the isolation of human pollinosis-
CC associated gene 513 cDNA

CC The invention relates to the human pollinosis-associated gene 787 which
CC exhibits significantly reduced expression in the T-cells of individuals
CC after the pollen-scattering season, relative to expression levels in T-
CC cells before the pollen-scattering season. The gene was isolated from T-
CC cells from individuals allergic to pollen using the differential display
CC method. The invention also relates to pollinosis-associated gene 787
CC primers and probes; methods of detection of pollinosis-associated gene
CC 787 nucleic acids; and a method of diagnosis of allergic diseases via the
CC detection of pollinosis-associated gene 787 nucleic acids. The invention
CC additionally encompasses a method of screening drug candidates for the
CC treatment of allergic disease by measuring the expression of pollinosis-
CC associated gene 787 in pollen antigen-stimulated T-cells in the presence
CC of a test compound relative to a control. Pollinosis- associated gene 787
CC is useful in the diagnosis of allergic diseases and in the screening of
CC drug candidates for the treatment of such diseases. The present sequence
CC represents a PCR primer used in the isolation of human pollinosis-
CC associated gene 787 cDNA

PT Pollinosis-associated gene 787 undergoing significantly low expression in
PT subjects after pollen scattering, useful in diagnosis of allergic
PT diseases and screening candidate compounds to regulate response of T
PT cells to antigen stimulus.
XX
PS Example 6; Page 40; 54pp; Japanese.
XX
CC The invention relates to the human pollinosis-associated gene 787 which
CC exhibits significantly reduced expression in the T-cells of individuals
CC after the pollen-scattering season, relative to expression levels in T-
CC cells before the pollen-scattering season. The gene was isolated from T-
CC cells from individuals allergic to pollen using the differential display
CC method. The invention also relates to pollinosis-associated gene 787
CC primers and probes; methods of detection of pollinosis-associated gene
CC 787 nucleic acids; and a method of diagnosis of allergic diseases via the
CC detection of pollinosis-associated gene 787 nucleic acids. The invention
CC additionally encompasses a method of screening drug candidates for the
CC treatment of allergic disease by measuring the expression of pollinosis-

CC

XX The invention relates to a method for examining allergic diseases
CC comprises determining the expression level of a gene containing, the
CC human cDNA appearing as ABK49633 which has homology with
CC acetyltransferases in the eosinophils of a patient and comparing the
CC expression level with that in the eosinophils of a healthy individual
CC (i.e. differential display). Also included are methods of screening for
CC candidate compounds which affect the expression level of the gene or the
CC activity of the protein encoded by the gene (including related proteins
CC and mutants), the use of probes based on the gene sequence in the
CC examination of allergic diseases, the use of reporter constructs in the
CC screening of candidate compounds, a vector containing a the transcription
CC -controlling region of the gene, cells transformed with the vector, an
CC antibody against the protein and a model animal for allergic diseases
CC which is a transgenic non-human vertebrate with lowering of expression
CC intensity of the gene in eosinophils. The method is examining allergic
CC diseases particularly atopic dermatitis which is also applicable in
CC screening candidate compounds for remedies. Such method can be performed
CC in high throughput, at low cost. The present sequence is a differential
CC display PCR primer for the cDNA encoding the human acetyltransferase-like
CC protein 20-90-05

XX New IKBKAP genes with mutations, useful for identifying a subject with
XX familial dysautonomia (FD), or for rapid carrier screening in the
XX Ashkenazi Jewish population, e.g. screening presymptomatic homozygotes or

PT prenatal diagnosis.
XX Disclosure; Fig 11; 109pp; English.
XX The present invention relates to methods and compositions useful for
XX detecting mutations which cause Familial Dysautonomia (FD, Riley-Day
XX syndrome, Hereditary Sensory and Autonomic Neuropathy Type III) [OMIM
XX 223900]. It was found that mutations in the IKBKAP gene (see ABQ80565)
XX are associated with FD. The mutation associated with the major haplotype
XX of FD, FD1 mutation, is a base pair (bp) mutation, where the thymine
XX nucleotide located at bp 6 of intron 20 in the IKBKAP gene is replaced
XX with a cytosine. This results in skipping of exon 20 in the mRNA from FD
XX patients, although they continue to express varying levels of wild-type
XX message in a tissue-specific manner. The mutation associated with the
XX minor haplotype, FD2 mutation, is a bp mutation, where the guanine
XX nucleotide at bp 2397 (bp 73 of exon 19) is replaced with a cytosine.
XX This bp mutation causes an arginine to proline missense mutation (R696P)
XX in the IKBKAP protein, which is predicted to disrupt a potential
XX phosphorylation site. The IKBKAP nucleic acid sequences are useful for
XX identifying a subject with FD and for rapid carrier screening. The IKBKAP
XX gene maps to chromosome 9q31. A mouse model of FD was created in an
XX example from the invention. Expression of murine Ikbkap was examined
XX using both mouse embryo and adult mouse multiple tissue Northern blots.
XX The blots were probed with a 1045bp PCR fragment that contains exons 2
XX through 11, which was generated using PCR primers ABQ80563-ABQ80564.
XX ABQ99662-ABQ99733 are the murine Ikbkap exon and intron boundaries

XX
CC The present invention relates to nucleic acid molecules which modulate
CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
CC and enzymatic nucleic acids such as hammerhead ribozymes, DNazymes,
CC inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed

CC are nucleic acid decoy molecules and aptamers that bind to HBV reverse
CC transcriptase and/or HBV reverse transcriptase primer sequences, as well
CC as oligonucleotides that specifically bind the Enhancer I region of HBV
CC DNA. The nucleic acids may be used to modulate the expression of HBV
CC genes and HBV viral replication. Also disclosed is a method for screening
CC compounds and/or potential therapies directed against HBV, and compounds
CC that modulate the expression and/or replication of HCV. The compounds and
CC methods of the invention are useful for the treatment of degenerative and
CC disease states related to HBV and HCV infection, replication and gene
CC expression such as cirrhosis, liver failure, and hepatocellular
CC carcinoma. The present sequence represents a substrate for one of the HCV
CC DNzyme or minus strand DNzyme sequences disclosed in the present
CC invention

 PT Identifying novel and useful genes by searching a database utilizing size

PT information about known nucleotide sequences to a specific sequence in a
 PT target fragment and the information about the specific sequence to
 PT extract a predicted gene.
 XX
 PS Disclosure; SEQ ID NO 3; 28pp; English.
 XX
 CC The invention relates to novel gene prediction methods. The novel methods
 CC comprise searching a gene database and utilising the information about
 CC the size of a known nucleotide sequence to a specific sequence in a
 CC target fragment and using the information about the specific sequence to
 CC extract a predicted gene. The methods are used for identifying novel and
 CC useful genes. The novel gene prediction methods make it possible to
 CC predict a gene contained in a DNA fragment obtained as a result of gene
 CC expression analysis effectively in a simple and easy manner. The methods
 CC make it possible to predict and identify a target fragment gene rapidly,
 CC and efficiency of genetic analysis is markedly improved. This
 CC polynucleotide sequence represents a primer used in the exemplification
 CC of the invention.

 XX Novel enzymatic nucleic acid that down-regulates expression of neurite
 PT growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or
 PT protein kinase PKR genes, for treating cancer and inflammatory disease.
 XX

PS Claim 59; SEQ ID NO 2942; 317pp; English.
XX
CC The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor
CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
CC invention are useful for treating: cerebrovascular accident, central
CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC disease, lupus, multiple sclerosis, transplant/graft rejection,
CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC nucleic acids of the invention are also useful for down-regulating the
CC expression of a target gene and as a diagnostic tool to examine genetic
CC drifts and mutations within diseased cells or to detect the presence of a
CC target RNA in a cell. The present RNA sequence represents a human PKR
CC substrate sequence.

PT Examining allergic diseases e.g. atopic dermatitis by differential
PT display based on gene expression of NOR-1 receptor protein, also
PT applicable in screening compounds for treatment of allergic diseases.
XX
PS Example 1; SEQ ID NO 5; 155pp; Japanese.
XX
CC This invention relates to a novel method for examining allergic diseases
CC that comprises comparing the expression levels of a gene encoding the NOR
CC -1 receptor protein between patients and healthy individuals.
CC Specifically, the NOR-1 gene, also referred to as MINOR, is expressed in
CC the specialist white blood cells known as eosinophils and is involved in
CC mediating an allergic reaction. The present invention describes a

CC differential display method that can identify the expression level of
CC this gene in order to identify its usefulness in diagnosing allergic
CC diseases such as atopic dermatitis. Furthermore, compositions can also be
CC used to screen compounds for the treatment of allergic diseases.
CC Accordingly, they exhibit various activities including antiallergic,
CC antiinflammatory and dermatological. This oligonucleotide sequence is a
CC PCR primer used to amplify human NOR-1 DNA in an exemplification of the
CC invention.

PT Identifying a subject at risk of breast cancer by detecting the presence
PT of polymorphic variations in the DLG1, KIAA0783, DPF3 or CENPC1 regions
PT which are associated with breast cancer in a nucleic acid sample from a
PT subject.
XX
PS Example 4; Page 78; 227pp; English.
XX
CC The present invention relates to a method for identifying a subject at
CC risk of breast cancer. The method comprising detecting the presence or
CC absence of one or more polymorphic variations associated with breast
CC cancer in a nucleic acid sample from a subject. The nucleic acid sample
CC comprises the DLG1 region (ADO79402), KIAA0783 region (ADO79403), DPF3
CC region (ADO79404) or CENPC1 region (ADO79405). The gene DLG1 (discs,
CC large homolog 1 (Drosophila)) is also known as synapse-associated protein
CC 97, hdlg or SAP97. DLG1 has been mapped to chromosomal position 3q29. The
CC gene KIAA0783 is also known as PHF14 and PHD finger protein 14. KIAA0783
CC has been mapped to chromosomal position 7p21.3. The KIAA0783 protein is a
CC novel gene with unknown function, however, being a zinc finger protein,
CC it likely to be a transcription factor. The gene DPF3 (D4, zinc and
CC double PHD fingers, family 3) is also known as CERD4, cer-d4, FLJ14079
CC and 2810403B03Rik. DPF3 is a Rho family guanine-nucleotide exchange
CC factor. DPF3 has been mapped to chromosomal position 14q24.3-q31.1. The
CC gene CENPC1 (centromere protein C1) is also known as Centromere
CC autoantigen C1. CENPC1 has been mapped to chromosomal position 4ql2-
CC ql3.3. CENPC1 is a centromere autoantigen and a component of the inner
CC kinetochore plate. The CENPC1 protein is required for maintaining proper
CC kinetochore size and a timely transition to anaphase. The method is
CC useful for identifying a subject at risk of breast cancer, for early
CC diagnosis, prevention and treatment of breast cancer, to analyze and
CC predict a response to a breast cancer treatment, and in clinical drug
CC trials. The present sequence was used in an example from the invention.

XX
CC The present invention relates to functionalised nanocrystals for use in
CC nonisotopic detection systems for biomolecules e.g. nucleic acids,
CC proteins, lipids or drugs. The nanocrystals have polynucleotide strands
CC attached to their surfaces with one end of the polynucleotide extending
CC outwardly from the nanocrystal. The present sequence is one such
CC polynucleotide. These nanocrystals are used with a second series of
CC nanocrystals, which have polynucleotides complementary to the first
CC polynucleotides, so that the respective complementary strands hybridise
CC to each other and form a dendrimer. This dendrimer produces a signal
CC which can then be detected e.g. fluorescence. The present sequence is
CC composed mainly of Thymine bases. This sequence may therefore be used
CC with a polynucleotide composed mainly of Adenine bases (AAA58385)

Determining nucleotide sequence signature, by obtaining optical values
for each nucleotide position in a group, adjusting them to get ratio of
final highest values near predetermined factor, generating base call.

PS      Disclosure; Page 19; 73pp; English.
XX
CC      The specification describes a method for determining a nucleotide
CC      sequence signature. The method comprises obtaining optical measurements
CC      with values indicating each nucleotide in a group of nucleotide
CC      positions, adjusting the values until the ratio of highest value in the
CC      set to next highest values in the set is at least a predetermined factor,
CC      and generating a base call for a position in the group based on results
CC      after the adjustment of values. The method is used for determining a
CC      signature of a nucleotide sequence, and for determining a nucleotide
CC      sequence of a polynucleotide from a series of optical measurements. The
CC      present sequence represents an adaptor, which is used in the course of
CC      the invention

New anti-proliferative substance comprising a radiolabeled DNA carrier,
useful for preventing or treating uncontrolled cellular proliferation
e.g. restenosis, cancer or malignant tumors.

Claim 13; SEQ ID NO 8; 28pp; English.

The invention relates to an anti-proliferative substance for preventing
uncontrolled cellular proliferation comprising a radiolabelled DNA
carrier, where a radioisotope is located internally within the DNA
sequence, at 5' end or at 3' end, and the radiolabelled DNA carrier
penetrates the cell membrane and is retained intracellularly for a time
sufficient for the radio-isotope to effect a dose therapy. The carrier in
the anti-proliferative substance is an oligonucleotide, which is linear
or a plasmid, which is circular. The plasmid is of viral or bacterial
origin. The oligonucleotide is a double- or a single-stranded DNA
sequence, which is conjugated with an antibody for cell-specific
delivery. The oligonucleotide is also conjugated to a stent surface,
cholesterol, oleic acid, linoleic acid, TGFalpha, antibody, TGFbeta,
cytokines or growth factors. The anti-proliferative substance is useful
for preventing or treating uncontrolled cellular proliferation. The
uncontrolled cell proliferation is a restenosis following angioplasty, or
cancer or a malignant tumour. The present sequence represents an
oligonucleotide carrier used in the invention.

CC Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide
CC primer extension (SNPE) primers, and the sequences of regions flanking
CC sites of single nucleotide polymorphisms SNPs. The present invention
CC includes kits for determining the presence or absence of a SNP, using the
CC oligonucleotides of the invention. The PCR primers are used to amplify a
CC SNP flanking sequence, the SNPE primer is used as a genotyping primer.
CC The oligonucleotides are useful for genotyping a nucleic acid sample by
CC performing a single-nucleotide primer extension reaction. The
CC oligonucleotides are useful for determining the presence, absence or
CC identity of a SNP and for genotyping nucleic acid samples, for e.g. to
CC assess by association analysis the genotype of an individual or group of
CC individuals, having a pathological phenotypic trait suspected of being
CC caused by one or more SNPs. Phenotypic traits include diseases e.g.
CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
CC dystrophy, familial hypercholesterolaemia, polycystic kidney disease,
CC osteogenesis imperfecta and acute intermittent porphyria. Phenotypic
CC traits also include symptoms of or susceptibility to multifactorial
CC disease of which a component is or may be genetic such as autoimmune
CC diseases, including, rheumatoid arthritis, multiple sclerosis,
CC inflammation, cancer, nervous system diseases and infection by pathogenic
CC microorganism. The method is also useful in forensic investigations and
CC paternity analysis. The present sequence represents a PCR primer specific
CC for a human SNP containing DNA sequence

PT Probes for detecting target nucleotide sequence in sample, has sequence
PT that forms hairpin structure having a double-stranded segment and single-
PT stranded loop collectively forming region complementary to target
PT sequence.
XX
PS Example 4; Page 49; 72pp; English.
XX
CC The present sequence is that of DNA-RNA-DNA hybrid oligonucleotide
CC AGT02013. This is one of a set of oligonucleotides (see ABA91527-30) used
CC to assess the minimum number of ribonucleotides in DNA-RNA chimeric
CC oligonucleotides required for RNase H cleavage. Each oligonucleotide of
CC the set had a different number of ribonucleotides, 2 in the present case.
CC The oligonucleotides were mixed with target DNA oligonucleotide AGT02009
CC (see ABA91531) and incubated with RNase H (5 U/ml) at 37 degrees C for 30
CC minutes. The results showed that 4 ribonucleotides were the minimum
CC number for RNA cleavage. The invention provides probes for nucleic acid
CC hybridisation. The probes form a hairpin structure comprising a double-
CC stranded stem and a single-stranded loop, and are capable of both
CC intramolecular and intermolecular hybridisation. The double-stranded stem
CC may comprise a methylphosphonate DNA:RNA hybrid that is resistant to
CC RNase H cleavage. When the probe hybridises with a target DNA, the RNA
CC strand in the DNA:RNA duplex becomes sensitive to RNase H treatment and
CC can be removed. Arrays and methods for nucleic acid hybridisation using
CC the probes are provided

XX
CC The present invention describes a pharmaceutical composition comprising a
CC nucleic acid (I) protein tyrosine phosphatase PTP10D, non-receptor
CC protein tyrosine kinase Tec, egg derived tyrosine phosphatase (EDTP) gene
CC family or encoded polypeptide, fragment or variant of nucleic acid
CC molecule or polypeptide, an antibody, an aptamer or receptor recognising
CC a nucleic acid molecule of PTP10D, Tec, or EDTP gene family or encoded
CC polypeptide, and a carrier, diluent and/or adjuvant. The pharmaceutical
CC composition can have antidiabetic, hypotensive, cardiac, antilipaemic,
CC osteopathic, cytostatic, anorectic and immunomodulator activities, and
CC can be used in gene therapy. The composition is useful for the
CC manufacture of an agent for detecting and/or verifying, for treating and
CC alleviating and/or preventing a disorder, including metabolic diseases
CC such as obesity and other body weight regulation disorders, as well as
CC related disorders such as eating disorder, cachexia, diabetes mellitus,
CC hypertension, coronary heart disease, hypercholesterolaemia,
CC dyslipidaemia, osteoarthritis, gallstones, cancers (cancers of the
CC reproductive organ), sleep apnea, and other diseases, in cells, cell
CC masses, organs and/or subjects. The components of the composition may
CC also be used in controlling the function of a gene and/or gene product
CC which is influenced and/or modified by a PTP10D, Tec, or EDTP homologous
CC polypeptide, and for identifying substances capable of interacting with a
CC PTP10D, Tec or EDTP homologous polypeptide. The nucleic acid molecule of
CC PTP10D, Tec, or EDTP family or their fragments, may be used in the
CC preparation of a non-human animal which over- or under-expresses the
CC PTP10D, Tec, or EDTP gene product. The present sequence represents a PCR
CC primer for mouse protein tyrosine phosphatase receptor type B precursor
CC (PTPRB), which is used in an example from the present invention

XX Minisequencing type oligonucleotide chip for detecting methylation of
PT promoter CpG islands of multiple genes, useful for detecting cancer.
PT
XX
PS Claim 13; SEQ ID NO 878; 248pp; Korean.
XX
XX This invention relates to a novel mini-sequencing type DNA
CC oligonucleotide chip. Specifically, it refers to a chip that is useful
CC for detecting methylation of promoter CpG islands occurring in multiple
CC genes. The present invention describes using oligonucleotide primers to
CC determine the position of a target gene and promoter CpG islands, this
CC constitutes treating DNA of the target gene with sodium bisulfite in
CC order to carry out methylation specific (MSP) PCR or multiplex MSP PCR to
CC amplify the sodium bisulfite treated DNA and sequencing the PCR product
CC to confirm the hypomethylation site of the promoter CpG islands of
CC multiple genes. Accordingly, the chip comprises primer sequences designed
CC from these PCR products that have amine linkers of 12 carbons attached to
CC the 5'-terminal, which are spotted onto the glass slide coated with 3-
CC aminopropyltrimethoxylan and 1,4-diisothiocyanate using an array robot.
CC The resulting minisequencing chip is useful for detecting cancer, thereby
CC accurately and rapidly detecting methylation of CpG islands of multiple
CC genes. This oligonucleotide sequence is a PCR primer given in an
CC exemplification of the invention.

PT
XX
XX Example 3; Page 30; 62pp; English.
PS
XX
XX The present sequence is that of a single mismatch target sequence for a molecular beacon comprising an oligonucleotide probe (see ABL57069) covalently attached at the 3' end to fluorescent dye and at the 5' end to a nanoparticle. In the native state, the probe forms a hairpin conformation with hybridised termini. The proximity of the fluorophore

CC and quencher (gold nanoparticle) in the molecular beacon results in
CC little or no detectable fluorescence. Upon hybridisation of the central
CC complementary stretch of the probe to a target sequence, such as the
CC present sequence, the hairpin undergoes a conformational change resulting
CC in an increase in fluorescence, the extent of which is proportional to
CC the amount of target sequence present. Experiments with the present
CC sequence and a perfectly-matched target (see ABL57071) showed that
CC hybridisation was very specific to the matched target. The invention
CC relates generally to the use of metal surface quenchers such as particles
CC or films for high sensitivity applications in, for example, detection and
CC diagnostic systems

PT New nucleic acid that modulates expression of the vanilloid receptor-1,
PT useful for control of pain or sensitivity disorders, comprises sequences
PT from control regions of the receptor gene.
XX
PS Disclosure; Page 48; 68pp; German.
XX
XX This invention describes a novel nucleic acid containing a specific
CC segment having at least one region that modulates expression of the VR1
CC (vanilloid receptor type 1) receptor, or a functional derivative, allele
CC or fragment of this region, or a sequence that hybridises to it under
CC standard conditions. The VR1 modulator is derived from one or more of
CC positions 221931-223344 of GenBank AL670399, 31673-36359 of AL663116, or
CC 44731-43231 or 36616-33151 of AF168787 and is involved in transmission of
CC pain, particularly in primary sensory neurons. The invention also
CC describes a vector that contains the VR1 modulator, host cells containing
CC this vector (other than human germ or embryonal stem cells) and a method
CC for modulating expression of the VR1 receptor by introducing the
CC modulator or the vector into a cell that contains the VR1 gene. The
CC products of the invention are used for detecting a transcription factor
CC from its binding to a regulatory sequence (or a double-stranded
CC oligonucleotide fragment of it), e.g. by Western blotting or enzyme-
CC linked immunosorbant assay, particularly for diagnosis of diseases
CC associated with overexpression or underexpression of the transcription
CC factor. The region that modulates VR1 receptor expression includes a
CC binding site for a transcription factor, e.g. MZF1, NFkappaB, NFAT or
CC GATA1. The nucleic acids of the invention, or vectors containing them,
CC are used for prevention or treatment of pain, also for treating
CC sensitivity disorders, e.g. analgesia, hypalgesia or hyperalgesia, also
CC neuralgia and myalgia, that are associated with activity of the VR1
CC receptor. This sequence represents a fragment of rat VR1 exon 1d DNA
XX which is capable of binding to a transcription factor.

XX Analyzing binding between macromolecules, useful for detecting nucleic

PT acids by hybridization, where a labeled detector molecule is immobilized

PT and becomes fluorescent only after specific binding.

XX

PS Example; Page 6; 11pp; German.

XX

CC The invention relates to a novel analytical method for examining binding

CC events between first and second macromolecules. The method comprises

CC preparing a surface on which a fluorescently-labelled first macromolecule

CC is bound and which is at least partly fitted with a fluorescence-

CC suppressing layer. A sample liquid containing the second macromolecule is

CC applied and fluorescence is measured. The first macromolecule has a

CC secondary structure such that its fluorescence is suppressed by the

CC suppressing layer when it is not specifically bound to the second

CC macromolecule, but fluorescence is not suppressed when the two

CC macromolecules are specifically bound. The method of the invention may be

CC used to detect hybridisation of RNA or, particularly DNA, especially for

CC detecting the presence of particular sequences in samples, but also for

CC studying reaction kinetics. The method allows the use of molecular

CC beacons that are simple to prepare or synthesise, particularly because

CC they do not require incorporation of a quencher. The current sequence is

CC that of the control probe of the invention which is targeted to the

CC fluorescent-labelled and bound DNA oligonucleotide in the binding

CC analysis method.

PT Enzymatic nucleic acid molecules having a hammer-head motif - used for

PT the treatment of arthritis, induction of graft tolerance or treatment of

PT auto-immune diseases.

XX

PS Example 1; Page 154; 307pp; English.

XX

CC The present invention describes a novel enzymatic nucleic acid (ENA)

CC having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues

CC ; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least

CC ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's

CC can inhibit collagenase and stromelysin production in the synovial

CC membrane of joints for the treatment or prevention of arthritis,

CC particularly osteoarthritis or rheumatoid arthritis. The ENA's can also

CC be used to treat antigen presenting cells of a donor to induce tolerance

CC in a recipient to an alloantigen of a donor. They can also be used for

CC enhancing graft tolerance or for treating autoimmune disease, and for

CC treating allergies and other inflammatory conditions. The ENA's can also

CC be used in diagnosis. Ribozyme therapy impacts on the expression of

CC stromelysin without introducing the non-specific effects upon gene

CC expression which accompany treatment with retinoids and dexamethasone.

CC The concentration of ribozyme required to affect a therapeutic treatment

CC is lower than that required of antisense molecules, and is highly

CC specific. The present sequence is used in the exemplification of the

CC present invention

PA (RIBO-) RIBOZYME PHARM INC.

CC comprises: (a) introducing into the system a random library of nucleic
CC acid catalysts (NAC) having a substrate binding domain (SBD), comprising
CC a random sequence, and a catalytic domain (CD); and (b) identifying NAC
CC in systems where modulation has occurred and/or determining the sequence
CC of at least part of the SBDs in such systems. Nucleic acid molecules with
CC endonuclease activity and catalytic activity, from the present invention,
CC are used to modulate gene expression in plant and mammalian cells and to
CC cleave target nucleic acid, particularly for treating systemic diseases
CC caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic
CC ascites and infection. They may also be used to detect genetic drift and
CC mutations in diseased cells and to determine c-raf RNA. Specifically NACs
CC with RNA-cleaving activity that modulate expression of the Raf gene, are
CC used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or
CC generally any condition associated with the level of c-raf. Introduction
CC of sugar/phosphate modifications increases stability against nuclease and
CC activity. AAV90922 to AAV93877 represent NACs that can be used in the
CC method, specifically for modulating the expression of a Raf gene

XX
CC The present invention describes nucleic acids (A) that interact stably
CC with a target sequence and contain at least one phosphoro(di)thioate
CC link, having endonuclease activity. (A), and more generally any catalytic
CC nucleic acid (A') that modulates expression of the oestrogen receptor
CC gene, are used to treat cancer (particularly of breast or endometrium),

CC in vivo or by transforming cells ex vivo and implanting treated cells, or
CC for other conditions associated with levels of oestrogen receptor.
CC Because of the high selectivity for targeted RNA, (A) can also be used to
CC correlate inhibition of gene expression with alterations in phenotype,
CC particularly for identification of therapeutic targets, and as research
CC reagents (for RNA, in the same way that restriction endonucleases are
CC used with DNA). The combination of modifications in (A) improves
CC resistance to nucleases, binding affinity and/or activity. AAA23503 to
CC AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and
CC AAA24748 to AAA25992 represent their corresponding target sequences.
CC AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme
CC sequences, and AAA26107 to AAA26218 represent their corresponding target
CC sequences. AAA26219 to AAA26271 represent other ribozyme sequences and
CC antisense oligonucleotides used in the exemplification of the present
CC invention

PT Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense

constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 68; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) pr an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg²⁺. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targeting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-targetting nucleic acid is used to cleave RNA of the NOGO gene in the presence of a divalent cation that is preferably Mg²⁺. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present sequence is a hammerhead ribozyme of the invention

XX New device useful for mapping mRNA transcripts and determining regions that may be effective targets for antisense mediated gene knockdown used for controlling gene expression for research or therapeutic purposes.

XX Disclosure; Page 7; 25pp; English.

The present invention provides a device and method for mapping mRNA transcripts and determining regions that may be effective targets for antisense mediated gene knockdown. Multiple oligonucleotides are immobilised at the same position on an array in the form of complex elements. Labelled target RNA is added to the array and allowed to anneal to any complementary oligonucleotides. The array is then scanned for signals and overlaps between the elements are identified. The mixture of oligonucleotides comprising each complex element is such that data can be obtained and interpreted. An oligonucleotide may be spaced from the array by extending its 5' or 3' end using spacing nucleotides or nucleotide analogues. For example, the present sequence may be used to space the 6-base sequence 5'-CGGAAC-3' from the array

XX PT New polypeptide, for raising antibodies that recognize hGDMPLP-1 proteins,
PT or as specific biomolecule capture probes for surface-enhanced laser
XX desorption ionization, comprises human myosin-like protein hGDMPLP-1.
PS Disclosure; SEQ ID NO 10038; 214pp; English.
XX CC The present invention describes a human genome-derived myosin-like
CC protein 1 (hGDMPLP-1). The protein and polynucleotide sequences of hGDMPLP-
CC 1 can be used in gene therapy and vaccine production. The hGDMPLP-1
CC nucleic acids can be used as probes to detect, characterise and quantify
CC hGDMPLP-1 nucleic acids in samples, as amplification substrates, to
CC provide initial substrates for the recombinant engineering of hGDMPLP-1
CC protein variants having desired phenotypic improvements, and for
CC expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be
CC used as immunogens to raise antibodies that specifically recognise hGDMPLP
CC -1 proteins, as standards in assays used to determine the concentration
CC and/or amount specifically of hGDMPLP proteins, as specific biomolecule
CC capture probes for surface-enhanced laser desorption ionisation, as
CC therapeutic supplement in patients having specific deficiency in hGDMPLP-1
CC production, and in vaccines or for replacement therapy. The
CC polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a
CC disorder associated with the expression of hGDMPLP-1, in particular heart
CC and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.
CC The present sequence represents an oligomer used in the screening of the
CC hGDMPLP-1 sequence in the exemplification of the present invention. N.B.
CC The sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from WIPO
CC at ftp.wipo.int/pub/published_pct_sequence

CC The invention relates to nucleic acid molecules that modulate replication
CC of the West Nile Virus (WNV). The nucleic acid molecules are useful for
CC treating a condition related to WNV infection e.g. pancreatitis,
CC encephalitis, myocarditis, meningitis, neurologic infection, hepatitis,
CC liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid
CC molecule is selected from the group of ribozymes consisting of

CC Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The
CC nucleic acid molecules further comprise at least five ribose residues, at
CC least ten 2'-O-methyl modifications, phosphorothioate linkages on at
CC least three of the 5' terminal nucleotides and a 3' end modification of a
CC 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080
CC are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given
CC in the specification. The present sequence is that of a nucleic acid
CC molecule of the invention

XX Disclosure; Page 562; 720pp; French.
PS
XX
CC The invention relates to a novel isolated 17 mer nucleic acid sequence,
CC given in the specification, a sequence containing at least 15 consecutive
CC nucleotides from the 17 mer sequence, a sequence with, after optimal
CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that
CC hybridizes to them under highly stringent conditions, or the complement
CC of any of them, or the corresponding RNA. The novel isolated nucleic
CC acids of the invention are useful as probes and primers for detecting,
CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
CC component of a gene chip, in vitro as (anti)sense reagents, and for
CC production of recombinant polypeptides. Any of the nucleic acids,
CC polypeptides, vectors containing the nucleic acids, cells containing the
CC vector or antibodies directed against the polypeptides are useful for
CC preparation of pharmaceuticals for prevention and/or treatment of viral
CC diseases that are characterised by development of tumours or cell
CC degeneration, specifically cancer but also Alzheimer's disease and
CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
CC patient samples is useful for diagnosis and/or prognosis of these
CC diseases. The polypeptides can also be used to generate antibodies, and
CC both the polypeptide and antibodies are useful as components of protein
CC chips. The nucleic acid sequences of the invention can be used in gene
CC therapy. This polynucleotide sequence represents a tumour suppression
CC related human fukutin oligonucleotide of the invention

CC The present invention relates to novel human zinc finger-containing
CC proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is
CC encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
CC MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC or in manufacturing a medicament for treating or preventing a disorder,
CC associated with decreased or increased expression or activity of MDZ3,
CC MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC acids and proteins are also useful for diagnosing or monitoring a disease
CC caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC acids can also be used as probes to detect and characterize gross
CC alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC useful in constructing microarrays for measuring gene expression. The
CC proteins are useful as therapeutic agents for gene therapy or as
CC vaccines. The present sequence was used to illustrate the invention.

CC The present invention relates to nucleic acid molecules which modulate
CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
CC and enzymatic nucleic acids such as hammerhead ribozymes, DNazymes,
CC inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed
CC are nucleic acid decoy molecules and aptamers that bind to HBV reverse

CC transcriptase and/or HBV reverse transcriptase primer sequences, as well
CC as oligonucleotides that specifically bind the Enhancer I region of HBV
CC DNA. The nucleic acids may be used to modulate the expression of HBV
CC genes and HBV viral replication. Also disclosed is a method for screening
CC compounds and/or potential therapies directed against HBV, and compounds
CC that modulate the expression and/or replication of HCV. The compounds and
CC methods of the invention are useful for the treatment of degenerative and
CC disease states related to HBV and HCV infection, replication and gene
CC expression such as cirrhosis, liver failure, and hepatocellular
CC carcinoma. The present sequence represents a substrate for one of the HCV
CC DNzyme or minus strand DNzyme sequences disclosed in the present

PS Disclosure; Page 493; 771pp; French.
XX

CC The invention relates to the isolation of 6327 nucleotide sequences,
CC fragments of at least 15 consecutive nucleotides of these nucleotides, a
CC sequence having at least 80% identity, after optimal alignment, with the
CC nucleotides, a sequence that hybridizes under stringent conditions with
CC the nucleotides, or the complement, or corresponding RNA, of the
CC nucleotides. The nucleotides are used as probes or primers for detecting,
CC identifying, quantifying and/or amplifying nucleic acids, as in vitro
CC sense and antisense sequences, of nucleotides involved in tumour
CC suppression or reversion, apoptosis and or viral resistance, to produce
CC recombinant polypeptides, and to prepare transgenic animals, as
CC experimental models. The nucleotides (also vectors containing them and
CC cells containing the vectors), the encoded polypeptides and antibodies
CC (Ab) against the polypeptide are useful for prevention and/or treatment
CC of viral infections or diseases characterized by development of tumours
CC or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
CC Analysis of the expression of the nucleotides can be used for diagnosis
CC and/or prognosis of these diseases. The nucleotides and polypeptides can
CC also be used to screen for their specific interactive molecules,
CC potentially useful for treating diseases associated with abnormal
CC expression of the nucleotides.

PT Determining structural parameters of native RNA involves applying RNA to
PT an oligonucleotide array and detecting binding of RNA using RNA dependent
PT nucleic acid modifying enzymes.
XX
PS Disclosure; Page 8; 24pp; English.
XX
CC The present invention describes a method for determining structural
CC parameters of native RNA by detecting binding of the native RNA to an
CC oligonucleotide array. The method comprises applying native RNA to
CC complementary oligonucleotides which anneal to accessible sequences in
CC the RNA, adding an RNA dependent nucleic acid modifying enzyme, removing
CC any unbound RNA, enzyme or other reaction components and detecting
CC modification(s) caused by the enzyme. Also described is a device for
CC determining structural parameters of native RNA by mapping RNA
CC transcripts, comprising an array which has immobilised oligonucleotides
CC represented on a surface support, where the oligonucleotides represented
CC have a reactive-OH group at their free 3' end, and units for extending
CC the 3'-OH group that is dependent on a complementary bp interaction
CC between specific immobilised oligonucleotides and the applied RNA. The
CC method is useful for determining structural parameters of native RNA. The
CC device is useful for carrying out the method and for mapping RNA
CC transcripts, and determining regions that may be effective targets for
CC antisense mediated gene knockdown. The present sequence represents an
CC oligonucleotide which is given in the exemplification of the present
XX invention

PI New device comprising a filter layer comprising a dry solid medium

DR comprising a hydrophilic solid matrix, and an isolation layer, useful for

XX storing and analyzing a nucleic acid containing moiety.

PT Example 1; SEQ ID NO 4; 14pp; English.

PS The invention relates to a device for storage and analysis of a nucleic

CC acid containing a moiety in a biological sample, comprising a filter

CC layer comprising a dry solid medium comprising a hydrophilic solid

CC matrix, and an isolation layer comprising a dry solid medium comprising a

CC neutral solid matrix attached to a composition comprising a detergent.

CC Storing and analysing a nucleic acid containing a moiety in a biological

CC sample comprises applying a biological sample to the filter layer,

CC filtering the components of the biological sample through the filter

CC layer to the isolation layer, retaining the nucleic acid components in

CC the isolation layer while removing the non-nucleic acid components,

CC drying the isolation layer, providing a primer and analysing the nucleic

CC acid components using at least one primer. The device and method are

CC useful for storing and analysing a nucleic acid containing a moiety in a

CC biological sample. They are also useful for identifying known or unknown

CC virions or bacteria contained in a fluid. This sequence represents a

CC reverse transcriptase PCR (RT-PCR) primer used in the scope of the

CC invention.

DR Novel enzymatic nucleic acid that down-regulates expression of neurite

XX growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or

PT protein kinase PKR genes, for treating cancer and inflammatory disease.

PS Claim 59; SEQ ID NO 2938; 317pp; English.

XX The invention comprises nucleic acids (e.g. antisense oligonucleotides)

CC that down regulate the expression or inhibit the function of a receptor

CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),

CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the

CC invention are useful for treating: cerebrovascular accident, central

CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,

CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,

CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune

CC disease, lupus, multiple sclerosis, transplant/graft rejection,

CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic

CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The

CC nucleic acids of the invention are also useful for down-regulating the

CC expression of a target gene and as a diagnostic tool to examine genetic

CC drifts and mutations within diseased cells or to detect the presence of a

CC target RNA in a cell. The present RNA sequence represents a human PKR

CC substrate sequence.

XX Novel enzymatic nucleic acid molecule such as DNazymes and inozymes
PT specifically cleaving RNA derived from hepatitis B virus and comprising
PT one or more binding arms, useful for treating hepatitis and cirrhosis.
XX Disclosure; SEQ ID NO 1745; 122pp; English.
PS The invention relates to an enzymatic nucleic acid molecule that
XX specifically cleaves RNA derived from hepatitis B virus (HBV) and
CC comprising one or more binding arms, without requiring the presence of a
CC 2'-OH group within the molecule for activity. The nucleic acids are
CC useful for treating hepatitis B virus infection, hepatitis,
CC hepatocellular carcinoma, cirrhosis and liver failure, either alone or in
CC combination with other therapies such as lamivudine and interferons. The
CC nucleic acids are useful as diagnostic tools to examine genetic drift and
CC mutations within diseased cells, for detecting the presence of HBV RNA in
CC a cell, for the study of RNA and for down-regulating gene expression of
CC target genes in bacterial, fungal, viral, plant or mammalian cells. This
CC sequence represents an HBV RNA target sequence, used in the scope of the
CC invention. Note: The sequence data for this patent is also available in
CC electronic format from USPTO at seqdata.uspto.gov/sequence.html.

XX

CC The invention relates to a novel polypeptide (I) comprising a sequence

CC (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully

CC defined in the specification, a fragment of at least 8 amino acids of

CC (S1), 95% deviation from (S1) which are conservative substitutions, and

CC 65% identity to (S1). A polypeptide of the invention acts as a agonist or

CC antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A

CC pharmaceutical composition of the invention is useful for treating or

CC preventing a disorder associated with decreased expression or activity of

CC hGDMLP-1, such as a disorder of heart and/or skeletal muscle function.

CC The present sequence represents a 17-mer nucleotide, used in the

CC invention for scanning the sequence represented in ACN63103

PT Sequencing complex genomes, present as fragments in a cosmid library - by
PT sequencing end-specific nucleotides of each clone then correlating with
PT spatial relationship of cosmid, esp. for mammalian chromosomes.
XX
PS Example 3; Page 44; 128pp; English.
XX
CC In a sequence-sample mapping procedure using a Giardia lamblia 20-genome
CC equivalent cosmid library, each end of the genomic insert in a cosmid was
CC detected as a vector/genomic chimera by hybridisation with probes
CC flanking the T3 and T7 promoter sites of sCos-1. The 1046 bp T3 probe was
CC amplified from sCos-1 with the primers AAQ80946 and AAQ80947 and the 1004
CC bp T7 probe was amplified with primers AAQ80948 and AAQ80949. The T7
CC probe was labelled with 35S- dATP and the T3 probe with 33P-dATP for dual
CC -label hybridisations. Maps were constructed by determining an order of
CC fragments with no gaps using a computer program. (Updated on 25-MAR-2003
CC to correct PN field.)

PT New antisense oligonucleotides to metabotropic glutamate receptor type 1
PT gene, which specifically hybridize to mRNA expressed from the gene useful
PT for treating disorders related to elevated glutamate level such as pain.
XX
PS Claim 2; Page 18; 97pp; English.
XX
CC The present invention relates to an antisense oligonucleotide derived
CC from the sequence of metabotropic glutamate receptor type 1 (mGluR1)
CC gene. The antisense oligonucleotide binds to a portion of mRNA expressed
CC from the gene or its splice variant. The binding of the oligonucleotide
CC to the mRNA is effective in decreasing the translation of the mRNA in a
CC host cell expressing the gene. The oligonucleotides are useful for
CC treating chronic pain caused by injury or inflammation of a nerve caused
CC by arthritis. The oligonucleotides may be used with an opioid analgesic.
CC They are also useful for minimizing glutamate neurotoxicity and/or
CC excitotoxicity associated with stroke, ischemia, CNS trauma,
CC neurodegenerative disorders, gastrointestinal disorders or to inhibit
CC tumour formation

PT New polynucleotides and polypeptides are useful in gene therapy, for
PT developing a diagnostic marker or medicines for regulating their
PT expression and activity, or as a target of gene therapy.
XX
PS Example 8; SEQ ID NO 5102; 305pp; English.
XX
CC The invention relates to a novel human polynucleotide and the encoded
CC polypeptide. A polynucleotide of the invention may have a use in gene
CC therapy. An oligonucleotide of the invention ADM06202-ADM06773 is useful
CC as a primer for synthesizing the polynucleotide or as a probe for
CC detecting the polynucleotide. The polynucleotides ADM01316-ADM03758 are
CC useful in gene therapy, for developing a diagnostic marker or medicines
CC for regulating their expression and activity, or as a target of gene
CC therapy. The proteins ADM03759-ADM06201 encoded by the polynucleotides
CC are useful as pharmaceutical agents. The present sequence represents an
CC oligonucleotide used in the invention.

PT New isolated polynucleotides comprising single nucleotide polymorphisms

PT of the cardiovascular gene, useful for assessing predisposition or
PT susceptibility to a cardiovascular disease, e.g. atherosclerosis,
XX restenosis or stroke.
PS Disclosure; Page 78; 187pp; English.
XX
CC The invention relates an isolated polynucleotide (I) encoded by a
CC cardiovascular associated (CA) gene, having allelic variation contained
CC in a functional surrounding like full length cDNA for CA gene
CC polypeptide, and with or without the CA gene promoter sequence. (I) is a
CC polynucleotide comprising single nucleotide polymorphisms predicting
CC cardiovascular disease. The polynucleotides are useful for assessing
CC predisposition or susceptibility to a cardiovascular disease, e.g.
CC atherosclerosis, ischemia/reperfusion, hypertension, restenosis, arterial
CC inflammation, myocardial infarction, and stroke. These may also be used
CC to predict personal medication schemes omitting adverse drug reactions,
CC or as probes for detecting genetic polymorphisms and as templates for the
CC recombinant production of normal or variant peptides/polypeptides encoded
CC by the genes. This sequence corresponds to a PCR primer to amplify one of
CC the genes of the invention.

PT Kit for diagnosing and treating T-cell associated diseases e.g.
PT autoimmune, degenerative nervous system and infectious disease, comprises
PT nucleic acid primers specifically priming and allowing amplification of a
PT Vbeta gene.
XX
PS Disclosure; SEQ ID NO 1251; 164pp; English.
XX
CC The invention relates to a kit for diagnosing and treating T-cell
CC associated diseases which comprises a panel of nucleic acid primers
CC specifically priming and allowing amplification of each Vbeta gene,
CC VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant
CC rejection and diagnosing and treating T-cell associated diseases
CC including autoimmune diseases, degenerative nervous system diseases,
CC graft versus host disease, hypersensitivity diseases, infectious diseases
CC and neoplastic diseases. Autoimmune diseases include Addison's disease,
CC atrophic gastritis. Degenerative nervous system diseases include multiple
CC sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type
CC I hypersensitivities such as contact with allergens that lead to
CC allergies, Type II hypersensitivities such as those present in
CC Goodpasture's syndrome and Type IV hypersensitivities such as those
CC manifested in leprosy. Infectious diseases include viral infections
CC caused by viruses such as HIV, fungal infections such as those caused by
CC the yeast genus Candida, parasitic infections such as those caused by
CC schistosomes, filaria and bacterial infections such as those caused by
CC Mycobacterium. Neoplastic diseases include lymphoproliferative diseases
CC such as leukaemias, lymphomas and cancers such as cancer of the brain,
CC breast. The present sequence represents a Vbeta point mutation PCR
CC primer.

PT Peptides having at least two new nucleotides - useful as primers in RT-
PT PCR.
XX
PS Example 1; Page 12; 19pp; Japanese.
XX
CC This sequence represents a primer of the invention. The invention relates
CC to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta
CC -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or
CC a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n =
CC natural number indicating the repetition of alpha; beta, delta = V or N;
CC V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or
CC thymine; gamma = thymine; k = natural number of 3 or over indicating the
CC repetition of gamma, in which thymine expressed by gamma is composed of
CC 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are
CC useful as primers for RT-PCR and determination of base sequences. The new
CC sequences allow for reproductive and highly efficient analysis of gene
CC sequences

 XX Polymorphic bovine DNA markers - used in genetic identification, gene
 XX mapping, and selective breeding.
 XX Table 7; Page 131; 517pp; English.
 XX The sequence is that of a bovine microsatellite sequence obtd. by
 CC screening a genomic library of bovine MboI-DNA fragments of between 250

CC and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of
CC 50 clones cross-hybridised. Assuming independent distribution of
CC microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
CC in the bovine genome is estimated at >100, 000. The sequence information
CC for ca. 230 such bovine microsatellites is summarised in the
CC specification and indexed herein (see below). The sequences upstream and
CC downstream of the microsatellite sequence were used to generate the
CC required PCR primers for in vitro amplification of the corresp.
CC microsatellite (using the program OPTIPRIM). The microsatellites may be
CC used to identify individuals, for parentage testing, and in the genetic
CC mapping of economic trait loci, or genes involved the determinism of
CC economically important traits esp. in cattle, to allow selective
CC breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
CC field.)

XX Identifying DNA encoding inducible or suppressible cytochrome P450 - by
PT screening for drugs which reduce the catabolism of retinoic acid, useful
PT in cancer chemotherapy and the treatment of acne and psoriasis.

PS Example 1; Page 51; 113pp; English.

XX This is a 3' poly(T) PCR primer used in the amplification of the
CC inducible cytochrome P450RAI gene which specifically metabolises a
CC derivative of the retinoic acid (RA). The cytochrome P450 gene in general
CC produces enzymes involved in the oxidative metabolism of endogenous and
CC exogenous compounds. The cytochrome P450 nucleotide sequence can be used
CC to induce or suppress the expression of its protein. P450RAI is highly
CC induced by RA in cell lines and tissues. This allows for the development
CC of a drug screen using promoters and nucleotide sequences to identify
CC drugs which are useful for reducing the catabolism of RA

XX PolyT oligonucleotides (see AAV12217-28) were used in reverse
CC transcription reactions on polyA+ RNA isolated from the fins of control
CC or retinoic acid-treated zebrafish (Danio rerio). Several combinations of
CC the polyT primers were used with degenerate upstream primers (see
CC AAV12229-33) for differential display PCR. Bands demonstrating
CC reproducible differential amplifications were found using the primers
CC given in AAV12221 and AAV12231. This PCR product was reamplified (see
CC AAV12234-35). A differential display product (see AAV12213) which
CC exhibited a dependence on the presence of retinoic acid for its
CC expression was isolated, and was used to isolate a full-length clone (see
CC AAV12203) coding for a novel retinoid metabolising protein (see
CC AAW44159), designated zP450RAI

XX
CC The present sequence represents a polynucleotide that is able to form a
CC triple helix with a double stranded sequence. Cytosine bases in the
CC present can be replaced with 5-methylcytosine for increased triplex
CC stability. The present sequence is used in the assay of the invention,
CC where it can be part of the anchor DNA or reporter DNA sequence. The
CC assay comprises adding a sample containing double-stranded DNA test
CC sequences to an aqueous medium containing at least one complex of anchor
CC DNA, attached to a solid support, and reporter DNA, where either a part
CC of the anchor DNA or reporter DNA is designed to form a triple-strand
CC structure with part of the test sequence. Triplex formation results in
CC displacement of the reporter DNA which is detected as an indication of
CC the presence of the DNA test sequence. The method is used to detect DNA
CC sequences, particularly for identification of bacteria (by detecting
CC genes for ribosomal RNA) in clinical samples, but also detection of
CC oncogenes and Hepatitis B virus

XX
CC This invention describes a novel method for the visual detection of
CC target nucleic acid presence in a sample. A preferred target is a
CC Mycobacterium complex nucleic acid sequence. The detection method uses
CC visual detection of a change in the hybridization without aid of
CC instrumentation. Multiple copies of a target nucleic acid sequence are
CC mixed with first and second detectable probes under hybridizing
CC conditions favouring particle agglutination via a bridging molecule
CC allowing for visual detection of the target nucleic acid sequence. The
CC bridging molecule enhances or inhibits formation of a hybridization
CC complex

XX Newly isolated nucleic acid molecule (designated p23) encoding a p23
PT polypeptide - useful for inducing a senescence phenotype in a cell.
XX Example 1; Page 18; 44pp; English.
XX The present invention describes human senescence factor p23. An
CC expression vector for p23 is useful for inducing a senescent phenotype in
CC a cell (preferably eukaryotic). This may help in regulating diseases,
CC including cancer, persistent inflammation, and various proliferative and
CC degenerative disorders. These transgenic cells are useful in gene therapy
CC for treating cancer, particularly where antisense oligonucleotides are
CC useful for blocking normal or mutant p23 expression in cancer cells or
CC other proliferating cells. Transgenic cells are also useful for producing
CC the p23 polypeptide in large quantities. The antibodies are useful for
CC raising antiserum against p23, and for identifying senescent cells in
CC culture and tissue biopsies. The p23 polynucleotides are useful for
CC modulating or altering p23 activity in a cell, and for identifying and
CC isolating the whole gene encoding p23, and variants of p23. Assays based
CC on p23 elements, which detect p23 levels and activity are useful as
CC diagnostic markers for staging tumours, determining prognosis, and/or
CC predicting therapeutic success. These elements also provide an assay for
CC detecting chromosomal rearrangements in chromosome 3 in a human cell. The
CC isolation of the p23 polynucleotide permits the manipulation of malignant
CC growth in cancer. The present sequence represents a primer used in an
CC example from the present invention

New conformationally restricted 3',5'-bridged nucleosides and
oligonucleotides useful as antisense therapeutics or as gene-specific
diagnostics.
Example 20; Col 16; 10pp; English.
The present sequence is an oligonucleotide containing 3'-C-amino-5'(S)-
C,3'-N-ethanothymidine, a bicyclic-sugar nucleoside. All nucleotides in
the sequence were incorporated by phosphoramidite chemistry using a DNA
synthesiser. Bicyclic sugar nucleosides are conformationally restricted
3',5'-bridged nucleosides which can be used as building blocks for
oligonucleotides. Oligonucleotides can be produced that have certain,
desired, geometrical shapes and entropy advantages. They may have
superior hybridisation to DNA and RNA, and excellent biological
stability. The conformationally-modified oligonucleotides may be useful
as antisense inhibitors of gene expression or as gene probes, and may
therefore be used in antisense therapeutics or gene-specific diagnostics

PS
XX The present invention describes a method for constructing a cDNA tag for
CC identifying an expressed gene. The method comprises: (a) preparation of
CC complementary deoxyribonucleic acid; (b) producing cDNA fragment by
CC cleavage with II type restriction enzyme; (c) obtaining a linker X-cDNA
CC fragment ligated material; (d) amplification of the linker X-cDNA tag-
CC linker Y ligated material; and (e) cleaving the amplification product.
CC The method can be used for the construction of cDNA tags for identifying
CC expressed genes, which is applicable in gene expression analysis, disease
CC diagnosis and identifying target for gene therapy, including the
CC clarification of difference in function or morphology of cells under
CC physiological or pathological conditions. The cDNA or cells for assay can
CC be specifically expressed, with reproducibility and accuracy in the
CC detection of genes. The present sequence represents an expressed gene
CC identification (EGI) cDNA tag related oligonucleotide which is used in an
CC example from the present invention

 XX

PS Disclosure; Col 13; 75pp; English.
 XX
 CC The present invention relates to retinoid (e.g., retinoic acid (RA),
 CC vitamin A) metabolising proteins and nucleic acid sequences encoding
 CC them. RA metabolising proteins contain a haeme-binding motif which is
 CC characteristic of the group of proteins known as cytochrome P450s. The
 CC sequences of the invention are useful in retinoid metabolism and in
 CC producing retinoic acid metabolising cytochrome P450s. They are
 CC particularly useful as targets for the treatment of certain cancers such
 CC as prostate cancer. The invention also relates to a method of screening
 CC drugs for their effect on activity of RA inducible proteins. The present
 CC DNA sequence is poly(T) PCR primer which is used for isolating retinoid
 CC regulating genes by differential display of mRNAs

PT Identifying a candidate polymorphic repeat within a coding sequence, for

PT understanding or treating genetic disease, comprises detecting tandem

PT repeats in a target coding sequence and scoring the repeats for

PT polymorphic probability.

XX
PS Example; Col 343; 588pp; English.

XX
CC The invention discloses a method for identifying a candidate polymorphic

CC repeat within a coding sequence (expressed sequence tag, EST), which

CC comprises detecting tandem repeats in a target coding sequence, scoring

CC the repeats for polymorphic probability and generating a dataset

CC correlating the repeats with polymorphic probability to identify a

CC candidate polymorphic repeat. The computational methods (polymorphic

CC marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are

CC useful for identifying and detecting candidate polymorphic repeats in

CC human genes, which can be used to understand, treat or eliminate genetic

CC diseases, predispositions or adverse drug-treatment reactions. Examples

CC of diseases linked to nucleotide repeats are Machado-Joseph, Haw River

CC syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis,

CC myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and

CC spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are

CC the polymorphic repeats identified for a search of human ESTs

XX
PS Example 1; SEQ ID NO 16; 46pp; English.
XX
CC The present sequence is that of a binding site for universal-tagged
CC specific primers ADF82924-ADF82929 in a template DNA sequence ADF82930
CC used in an example from the invention. Experiments were performed to
CC determine whether locked nucleic acid (LNA) substitution of bases in
```

```
CC universal-tagged specific primers had an effect on the efficiency of PCR
CC amplification. Real-time analysis was performed on 5'-nuclease assay PCR
CC reactions using the template, 5'-nuclease forward and reverse primers, a
CC 5'-nuclease probe and the universal-tagged primers, specifically designed
CC to have homology with the template and to contain a base substitution
CC with 0, 1, 2, 3 or 5 LNA bases. Cycle threshold values indicated that the
CC higher melting temperatures provided by substitution with LNA bases did
CC not correlate with greater efficiency in PCR amplification. The invention
CC relates to the use of universal-tagged primers for amplification of DNA,
CC especially human genomic DNA, optionally including single nucleotide
CC polymorphism (SNP) genotyping. The primers may include LNA bases.

PT Amplifying for RNA in a sample, useful for improving RNA polymerase based
PT RNA transcription from a polynucleotide template, comprises eliminating
PT single-stranded oligonucleotide from the transcription sample.
XX
PS Example 1; SEQ ID NO 4; 26pp; English.
XX
CC The invention relates to amplifying for RNA in a sample comprises
CC eliminating single-stranded oligonucleotide from the transcription
CC sample. The method involves synthesizing single-stranded cDNA by
CC incubating the sample RNA with reverse transcriptase and an
CC oligonucleotide primer that primes synthesis in a direction toward 5' end
CC of the RNA; converting the single-stranded cDNA into double-stranded cDNA
CC to form a transcription sample containing a cDNA template; eliminating
CC single-stranded oligonucleotide from the transcription sample; and
CC transcribing the cDNA template into RNA using an RNA polymerase. The
CC method is useful for improving RNA polymerase based RNA transcription
CC from a polynucleotide template. The method inhibits the undesired non-
CC template derived production of RNA in the transcription reaction.
CC Sequences ADI34483-ADI34489 represent oligonucleotides used in a T7 RNA
CC transcription reaction.

PT      Typing genes that contain polymorphic microsatellite loci, useful for
PT      identifying predisposition to disease, by amplification and determining
PT      length of amplicons.
XX
PS      Example 3; Page 31; 64pp; German.
XX
CC      The invention describes a method of typing (M1) a gene (I) that has one
CC      or more polymorphic microsatellite loci (PML). The method comprises: PCR
CC      amplification of at least one DNA region of (I) that includes PML, using
CC      as template a DNA sample containing at least one segment of (I); and
CC      determining the length of the resulting amplicon(s). Also described are:
CC      a method of determining (M2) microsatellite markers (MM) for
CC      predisposition to a disease, associated with a gene that includes one or
CC      more PML; and prediagnosis (M3) of diseases associated with gene that
CC      include PML. The method is used to identify microsatellite markers, in a
CC      disease-related gene, that are associated with a predisposition to
CC      diseases and for prediagnosis of such diseases, especially prion diseases
CC      but also cystic fibrosis, malignant hyperthermia syndrome in pigs and
CC      metabolic diseases; also to type genes that encode milk proteins,
CC      hormones or transcription factors. The method is simpler, quicker and
CC      particularly less expensive than known methods based on sequencing. This
CC      sequence represents a primer used to genotype a region of the sheep prion
CC      protein (PrP) comprising a polymorphic microsatellite locus.

PT      Typing genes that contain polymorphic microsatellite loci, useful for
PT      identifying predisposition to disease, by amplification and determining
PT      length of amplicons.
XX
PS      Example 3; Page 31; 64pp; German.
XX
CC      The invention describes a method of typing (M1) a gene (I) that has one
CC      or more polymorphic microsatellite loci (PML). The method comprises: PCR
CC      amplification of at least one DNA region of (I) that includes PML, using
CC      as template a DNA sample containing at least one segment of (I); and
CC      determining the length of the resulting amplicon(s). Also described are:
CC      a method of determining (M2) microsatellite markers (MM) for
CC      predisposition to a disease, associated with a gene that includes one or
CC      more PML; and prediagnosis (M3) of diseases associated with gene that
CC      include PML. The method is used to identify microsatellite markers, in a
CC      disease-related gene, that are associated with a predisposition to
CC      diseases and for prediagnosis of such diseases, especially prion diseases
CC      but also cystic fibrosis, malignant hyperthermia syndrome in pigs and
CC      metabolic diseases; also to type genes that encode milk proteins,
CC      hormones or transcription factors. The method is simpler, quicker and
CC      particularly less expensive than known methods based on sequencing. This
CC      sequence represents a primer used to genotype a region of the sheep prion
CC      protein (PrP) comprising a polymorphic microsatellite locus.

CC The present sequence represents a preferred target sequence for an
CC enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the
CC nucleotide base position indicated in the DE line. Regions of the mRNA
CC that do not form secondary folding structures and that contain potential
CC hammerhead and hairpin ribozyme cleavage sites were identified by
CC computer analysis. Ribozymes directed against these mRNA sequences were
CC designed and synthesised with modifications that improve their nuclease
CC resistance. The ribozymes cleave the ICAM-1 target sequences and thereby
CC inhibit ICAM-1 expression, making them useful for reducing transplant
CC rejection and alleviating symptoms in patients with rheumatoid arthritis,
CC asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to
CC correct PI field.)

CC This sequence represents a primer of the invention. The invention relates
CC to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta
CC -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or
CC a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n =
CC natural number indicating the repetition of alpha; beta, delta = V or N;
CC V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or
CC thymine; gamma = thymine; k = natural number of 3 or over indicating the
CC repetition of gamma, in which thymine expressed by gamma is composed of
CC 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are
CC useful as primers for RT-PCR and determination of base sequences. The new
CC sequences allow for reproductive and highly efficient analysis of gene

PT Ameliorating the effects of a disorder, e.g. psoriasis, by administering
PT UV (ultra-violet) treatment (optional) and an antisense nucleic acid that
PT inhibits or reduces growth factor mediated cell proliferation and/or
PT inflammation.
XX
PS Example 7; Page 47; 201pp; English.
XX
CC The present invention relates to a method for ameliorating the effects of
CC skin disorders. The method comprises contacting the skin with an
CC antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1
CC receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of
CC inhibiting or reducing growth factor mediated cell proliferation,
CC inflammation and/or other disorders. The present sequence is an
CC oligonucleotide which can be used to design the antisense
CC oligonucleotides of the present invention (see AAF45151 and AAF45153-
CC F45161). The method is useful for ameliorating the effects of psoriasis,
CC ichthyosis, pityriasis, ruba, pilaris, serborrhea, keloids, keratosis,
CC neoplasias, scleroderma, warts, benign growths, cancers of the skin, a
CC hyperneovascular condition such as a neovascular condition of the retina,
CC brain or skin, growth factor-mediated malignancies, other sclerotic
CC disease, kidney disease, hyperproliferation of the inside of blood

PS Example 6; Fig 20A; 108pp; English.
XX
CC The present invention relates to methods and oligonucleotides for forming
CC a triple-helix comprising a double helical nucleic acid comprising first
CC and second substantially complementary strands, and an oligonucleotide
CC bound to a purine-rich target sequence within the double helical nucleic
CC acid, where the oligonucleotide binds in a parallel and antiparallel
CC orientation, respectively, to target sequences on alternate strands of
CC the double helical nucleic acid. The method has therapeutic applications,

CC where gene expression is controlled by selective triple-helix formation
CC within expression regulatory sequences of a target gene. The
CC oligonucleotides can be used to form triple-helices, and are useful to
CC detect the presence or absence of specific sequences within genomic DNA
CC for diagnostic and therapeutic purposes. The oligonucleotides can be
CC selected to specifically bind to pathogenic double-stranded DNA including
CC specific sequences required by pathogenic bacteria or viruses for
CC replication or virulence, reducing their pathogenicity. Alternatively,
CC the oligonucleotide can be chosen to target a unique sequence of the
CC pathogen which is not found in the genome of pathogen's host. The
CC oligonucleotides can be used in cancer treatment by way of triple-helix
CC suppression of specific oncogenes including those of endogenous or viral
CC origin. Such therapeutic oligonucleotides are capable of forming triple-
CC helices with such sequences in cancerous cells containing the activated
CC oncogene, so preferentially killing or repressing the cancer causing
CC cell. The present sequence represents an oligonucleotide used in the
CC methods of the present invention

XX Identifying a candidate polymorphic repeat within a coding sequence, for
PT understanding or treating genetic disease, comprises detecting tandem
PT repeats in a target coding sequence and scoring the repeats for
PT polymorphic probability.

XX Example; Col 747; 588pp; English.

CC The invention discloses a method for identifying a candidate polymorphic
CC repeat within a coding sequence (expressed sequence tag, EST), which
CC comprises detecting tandem repeats in a target coding sequence, scoring
CC the repeats for polymorphic probability and generating a dataset
CC correlating the repeats with polymorphic probability to identify a
CC candidate polymorphic repeat. The computational methods (polymorphic
CC marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are
CC useful for identifying and detecting candidate polymorphic repeats in
CC human genes, which can be used to understand, treat or eliminate genetic
CC diseases, predispositions or adverse drug-treatment reactions. Examples
CC of diseases linked to nucleotide repeats are Machado-Joseph, Haw River
CC syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxia,
CC myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and
CC spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are
CC the polymorphic repeats identified for a search of human ESTs

PT New nucleic acids that interact, and optionally cleave, target sequences,
PT used to treat cancer.
XX
PS Claim 77; Page 79; 148pp; English.
XX
CC The present invention describes nucleic acids (A) that interact stably
CC with a target sequence and contain at least one phosphoro(di)thioate
CC link, having endonuclease activity. (A), and more generally any catalytic
CC nucleic acid (A') that modulates expression of the oestrogen receptor
CC gene, are used to treat cancer (particularly of breast or endometrium),
CC in vivo or by transforming cells ex vivo and implanting treated cells, or
CC for other conditions associated with levels of oestrogen receptor.
CC Because of the high selectivity for targeted RNA, (A) can also be used to
CC correlate inhibition of gene expression with alterations in phenotype,
CC particularly for identification of therapeutic targets, and as research
CC reagents (for RNA, in the same way that restriction endonucleases are
CC used with DNA). The combination of modifications in (A) improves
CC resistance to nucleases, binding affinity and/or activity. AAA23503 to
CC AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and
CC AAA24748 to AAA25992 represent their corresponding target sequences.
CC AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme
CC sequences, and AAA26107 to AAA26218 represent their corresponding target
CC sequences. AAA26219 to AAA26271 represent other ribozyme sequences and
CC antisense oligonucleotides used in the exemplification of the present
XX invention

XX
CC The invention relates to an oligonucleotide for targeted alteration of a
CC genetic sequence, which comprises a single-stranded oligonucleotide
CC having a DNA domain. The DNA domain has at least one mismatch with
CC respect to the genetic sequence to be altered and further comprises
CC chemical modifications of the oligonucleotide. The chemical modifications
CC consist of o-methyl modification, an LNA modification, two or more
CC phosphorothioate linkages on a terminus, or a combination of any two or
CC more of these modifications. The oligonucleotides are useful for
CC directing repair or alteration of plant genetic information. The
CC oligonucleotides are particularly useful for creating plants with desired
CC phenotypes, e.g. environmental or abiotic stress tolerance, improved
CC nutritional value (e.g. altering amino acid content of plants or
CC conferring amino acid over production), herbicide resistance (e.g.

CC glyphosate resistance, imidazolinone and sulphonylurea herbicide
CC resistance, porphyrlic herbicide resistance or triazine resistance),
CC disease resistance, modified oil production, modified starch production
CC (e.g. increased starch or production of waxy starch), altered floral
CC morphology (e.g. male-sterile plants) or modified fatty acid content
CC (e.g. reduced palmitate, increased stearate or reduced linolenic acid).

XX
CC The present invention relates to nucleic acid molecules which modulate
CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
CC and enzymatic nucleic acids such as hammerhead ribozymes, DNazymes,
CC inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed
CC are nucleic acid decoy molecules and aptamers that bind to HBV reverse
CC transcriptase and/or HBV reverse transcriptase primer sequences, as well
CC as oligonucleotides that specifically bind the Enhancer I region of HBV
CC DNA. The nucleic acids may be used to modulate the expression of HBV
CC genes and HBV viral replication. Also disclosed is a method for screening
CC compounds and/or potential therapies directed against HBV, and compounds
CC that modulate the expression and/or replication of HCV. The compounds and
CC methods of the invention are useful for the treatment of degenerative and
CC disease states related to HBV and HCV infection, replication and gene
CC expression such as cirrhosis, liver failure, and hepatocellular
CC carcinoma. The present sequence represents a substrate for one of the HCV
CC DNazyme or minus strand DNazyme sequences disclosed in the present
CC invention

XX
CC The invention relates to the isolation of 6327 nucleotide sequences,
CC fragments of at least 15 consecutive nucleotides of these nucleotides, a
CC sequence having at least 80% identity, after optimal alignment, with the
CC nucleotides, a sequence that hybridizes under stringent conditions with
CC the nucleotides, or the complement, or corresponding RNA, of the
CC nucleotides. The nucleotides are used as probes or primers for detecting,
CC identifying, quantifying and/or amplifying nucleic acids, as in vitro
CC sense and antisense sequences, of nucleotides involved in tumour
CC suppression or reversion, apoptosis and or viral resistance, to produce
CC recombinant polypeptides, and to prepare transgenic animals, as
CC experimental models. The nucleotides (also vectors containing them and
CC cells containing the vectors), the encoded polypeptides and antibodies
CC (Ab) against the polypeptide are useful for prevention and/or treatment
CC of viral infections or diseases characterized by development of tumours
CC or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
CC Analysis of the expression of the nucleotides can be used for diagnosis
CC and/or prognosis of these diseases. The nucleotides and polypeptides can
CC also be used to screen for their specific interactive molecules,
CC potentially useful for treating diseases associated with abnormal
CC expression of the nucleotides.

PT New isolated nucleic acid, useful for treating viral diseases associated
PT with tumors and cell degeneration, also related polypeptides, antibodies
PT and transfected cells.

XX PS Disclosure; SEQ ID NO 4083; 30pp; French.

XX CC This invention relates to novel isolated nucleic acid sequences involved

CC in the phenomena of tumour suppression, tumour reversion, apoptosis

CC and/or resistance to viruses. The invention may be useful for the

CC development of compounds with a cytostatic, virucide, neuroprotective,

CC nontropic or neuroleptic activity. The DNA sequences may be useful as

CC probes and primers for detecting, indentifying, quantifying and/or

CC amplifying nucleic acid, for example as one component of a gene chip, in

CC vitro as antisense reagents and for production of recombinant

CC polypeptides. The invention may therefore be useful for preparation of

CC pharmaceuticals for prevention and/or treatment of viral diseases that

CC are characterised by development of tumours or cell degeneration,

CC specifically cancer but also Alzheimer's disease and schizophrenia. The

CC present sequence is that of a nucleic acid sequence of the invention.

CC Note: The sequence data for this patent did not form part of the printed

CC specification, but was obtained in electronic format directly from WIPO

CC at ftp.wipo.int/pub/publishedpct_sequences

CC The 3' end of this oligonucleotide carries 1,3-propanediol. The oligo is one of four oligonucleotides which were designed to specifically bind and cross-link to the duplex target sequence AAQ20004. Oligo #2 has the covalent cross-linking group, i.e. N4N4-ethanocytosine, at its 3' end. An assay for crosslinked triple helix showed considerable reaction with Oligo #2 and with Oligo #1 (see AAQ20005) which has the crosslinking group at the 5' end. The most complete reaction was seen with Oligo #3 (see AAQ20007) having N4N4-ethanocytosine at both the 5' and 3' termini. A control oligo with no cross-linking group showed no reaction. The half-life of the cross-linking reaction for Oligo #2 was ca. 1 hr (1 microm); Oligo #1 showed a rate four times slower. See also AAQ20008

PT New anti:sense hepatitis C virus oligo:nucleotide(s) - used for
PT inhibiting HCV RNA translation, for the treatment or prevention of HCV
PT infection.
XX
PS Claim 1; Page 31; 50pp; English.
XX
CC The present oligonucleotide (ON) inhibits the expression of hepatitis C
CC virus (HCV) RNA, specifically HCV type II protein synthesis is inhibited
CC by about 50%. The ONs of the invention inhibit translation of HCV types I
CC -V RNA in vivo, ex vivo or in vitro, and can therefore be used to treat
CC or prevent HCV infection. The antisense ONs comprise 10-28 nucleotides
CC complementary to the entire HCV 5'-non-coding and part of the core
CC region. The A or S in the ONs name denotes antisense or sense, and the
CC no. indicates the position of the 5'-end of the ON. The ON was tested at
CC 10 fold molar excess to HCV RNA

PT products for diagnosis or treatment of body weight disorders, e.g.

PT obesity, cachexia, anorexia and bulimia.

XX PS Example; Page 122; 265pp; English.

XX CC Forward and reverse PCR primers (AAT69614 and AAT69615) are based on the

CC 3' sequence of mouse Ob receptor (ObR) cDNA clone famj5312 (see also

CC AAT69590). They revealed a polymorphism on SSCP gels between C57Bl/6J

CC genomic DNA and wild-derived Mus spretus strain SPRET/Ei DNA. The

CC polymorphism allowed the genetic mapping of famj5312 to murine chromosome

CC 4, approx. 2.2 cm distal to the marker D4Mit9 and 4.6 cm proximal to the

CC marker D4Mit46. This mapping confirmed the results obtd. using another

CC primer pair (AAT69612-13) derived from famj5312

XX
PS Claim 12; Page 8-24; 47pp; English.
XX
CC Sequences AAV46501-V47446 are anti-sense oligonucleotides that target the
CC human adenosine A1 receptor, the design of which required the secondary
CC structure of this targets mRNA. The adenosine receptor mRNA secondary
CC structure was both analysed and used to construct antisense
CC oligonucleotides containing a phosphorothioate backbone. Once the
CC antisense molecules are created they can be used to target their
CC predetermined target, thus causing the gene product to decrease. The
CC antisense oligonucleotides were targeted to specific mRNA regions
CC containing either a junction between the intron and exon, or where they
CC may overlap the initiation codon. The receptor is a member of the G-
CC protein coupled family of cell surface receptors that have 7-
CC transmembrane segments. These oligonucleotides can be used to treat or
CC prevent conditions associated with bronchoconstriction and/or lung
CC inflammation in humans or other animals e.g. asthma, pulmonary disease,
CC allergy, emphysema and cystic fibrosis

XX Novel ribozymes for modulating the synthesis, expression and/or stability
PT of an mRNA encoding an angiogenic factors.
XX Claim 54; Page 230; 305pp; English.
XX The present invention describes enzymatic nucleic acid molecules with RNA
CC cleaving activity, which specifically cleave RNA encoded by an aryl
CC hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3
CC gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to
CC AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT,
CC and AAA17168 to AAA17560 and AAA17623 to AAA17684 represent their
CC corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to
CC AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19086
CC and AAA19155 to AAA19222 represent their corresponding target sequences;
CC AAA19223 to AAA20361 and AAA21501 to AAA21595 represent ribozyme
CC sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and
CC AAA21596 to AAA21688 represent their corresponding target sequences;
CC AAA21689 to AAA22475 and AAA23263 to AAA23342 represent ribozyme
CC for integrin subunit beta 3, and AAA22476 to AAA23262, AAA23343 to
CC AAA23422 represent their corresponding target sequences. The ribozymes of
CC the invention are used for modulating the synthesis, expression and/or
CC stability of an mRNA encoding angiogenic factor, especially ARNT,
CC integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are
CC especially used to treat cancer, diabetic retinopathy, age related
CC macular degeneration (ARMD), inflammation, and arthritis, as well as
CC neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris,
CC angiofibroma of tuberosus sclerosis, pot-wine stains, Sturge Weber
CC syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome,
CC and other syndromes and diseases related to the levels of ARNT, Tie-2,
CC integrin subunit alpha-6, or integrin subunit beta-3

PT used as antiviral agents and synthons.
XX
PS Claim 177; Page 162; 259pp; English.
XX
CC A method has been developed for the identification of a nucleic acid
CC capable of modulating a process in a biological system. The method
CC comprises: (a) introducing into the system a random library of nucleic
CC acid catalysts (NAC) having a substrate binding domain (SBD), comprising
CC a random sequence, and a catalytic domain (CD); and (b) identifying NAC
CC in systems where modulation has occurred and/or determining the sequence
CC of at least part of the SBDs in such systems. Nucleic acid molecules with
CC endonuclease activity and catalytic activity, from the present invention,
CC are used to modulate gene expression in plant and mammalian cells and to
CC cleave target nucleic acid, particularly for treating systemic diseases
CC caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic
CC ascites and infection. They may also be used to detect genetic drift and
CC mutations in diseased cells and to determine c-raf RNA. Specifically NACs
CC with RNA-cleaving activity that modulate expression of the Raf gene, are
CC used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or
CC generally any condition associated with the level of c-raf. Introduction
CC of sugar/phosphate modifications increases stability against nuclease and
CC activity. AAV90922 to AAV93877 represent NACs that can be used in the
CC method, specifically for modulating the expression of a Raf gene

CC The present invention describes a new composition comprising an antisense	
CC oligonucleotide (ON) with low adenosine (up to 15%), which targets	
CC nucleic acids involved in bronchoconstriction, allergies, and/or	
CC inflammation. The ON can have antiinflammatory, antiallergic,	
CC antiasthmatic, cytostatic and analgesic activities. The compositions are	
CC useful for the treatment of diseases associated with inflammation,	
CC impaired airways, including lung disease and diseases whose secondary	
CC effects afflict the lungs of a subject. They can be used for treating	
CC e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,	
CC impeded respiration, respiratory distress syndrome, pain, cystic	
CC fibrosis, pulmonary hypertension, emphysema, chronic obstructive	
CC pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,	
CC carcinomas, and cancers which may metastasise to the lungs, including	
CC breast and prostate cancer. The reduction of the adenosine content of the	
CC ONs reduces side effects. The A-containing ONs break down with the	
CC release of deoxyadenosine which activates adenosine receptors causing	
CC bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the	
CC nucleotide sequences given in the sequence listing from the present	
CC invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185	
CC sequences are also called SEQ ID NO:1 to 185, but the sequences differ	
CC from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to	
CC AAA33992) are specifically claimed ONs from the present invention. N.B.

PT Antisense oligonucleotide to Hepatitis C virus RNA, useful for treating Hepatitis C virus infections.
XX
PS Claim 24; Col 25; 31pp; English.
XX
CC This sequence is an antisense oligonucleotide that hybridises to Hepatitis C virus (HCV) RNA, under physiological conditions. The invention relates to HCV antisense oligonucleotides, and also for a vector comprising a nucleotide sequence which is transcribed in an animal cell to generate an antisense oligonucleotide. The oligonucleotides have virucide, hepatotropic and anti-inflammatory activity, and are useful for treating HCV infection by inhibiting translation of type I-V HCV RNA.
CC Hepatitis C virus is a positive strand RNA virus, and is the major causative agent of post-transfusion hepatitis. Persistent HCV infection can lead to chronic hepatitis, cirrhosis, and hepatocellular carcinoma

CC	The present invention describes a pharmaceutical composition, comprising at least one agent (I) that prevents, alleviates and/or inhibits adenosine-mediated cardiopulmonary and/or renal damage and/or failure.	
CC	(I) is an adenosine A2a receptor agonist (Ia), or an oligonucleotide (Ib), containing less than 15% adenosine (A), that is antisense to target genes or corresponding RNA, to genomic flanking regions (i.e. 5' or 3', ends or segments between coding and non-coding sequences), or to all segments of mRNA encoding the adenosine A1, A2a, A2b or A3 receptors, and has A1, A2b or A3 agonist activity or A2a antagonist activity (or at least no agonist activity at this receptor). (I) may be a mixture of (Ia) and (Ib), and optionally also contains one or more surfactants. The compositions are used to prevent, alleviate and/or treat adenosine receptor-mediated cardiac, lung and/or renal damage or failure (particularly where associated with ischaemia, toxin release and/or administration of drugs or imaging agents, e.g. adenosine for treating supraventricular tachycardia); (adult) respiratory distress syndrome (e.g. associated with sepsis); allergic rhinitis; chronic obstructive pulmonary disease; cardiopulmonary hypoxia associated with administration of stress-test agents, particularly where such conditions are associated with acute inflammation. AAA02717, AAA02719, AAA02721 and AAA02723 to AAA03715 represent specifically claimed phosphorothioate antisense oligonucleotides for use in the composition of the present invention.	
CC	AAA02718, AAA02720, AAA02722 and AAA03716 to AAA03720 represent other phosphorothioate oligonucleotides used in the exemplification of the present invention

DR Low adenosine (A) content antisense oligonucleotides which do not trigger
PT adenosine receptors during metabolism, useful e.g. for treating cancers
PT and respiratory obstructions.
XX Claim 14; Page 120; 1592pp; English.
PS The present invention describes low adenosine (A) content antisense
XX oligonucleotides and compositions (I) comprising them. In the antisense
CC oligonucleotides the A is replaced by a 'Universal' or alternative base.
CC (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
CC immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
CC The antisense oligonucleotides and (I) can be used to down-regulate the
CC expression and or activity of target polypeptides associated with
CC lung/respiratory disorders and malignancies, such as stimulating and
CC activating peptide factors and transmitters, transcription factors,
CC immunoglobulins and antibodies, antibody receptors, cytokines and
CC chemokines, endogenously produced specific and non-specific enzymes,
CC binding proteins, adhesion molecules and their receptors, cytokine and
CC chemokine receptors, adenosine receptors, bradykinin receptors, central
CC nervous system (CNS) and peripheral nervous and non-nervous system
CC receptors, CNS and peripheral nervous and non-nervous system peptide
CC transmitters, defensins, growth factors, vasoactive peptides and
CC receptors, binding proteins and malignancy associated proteins. The
CC antisense oligonucleotides may be used in this way to treat disorders
CC including respiratory obstruction (especially pulmonary obstruction
CC and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or

CC surfactant hypoproduction which are associated with a disease or
CC condition selected from pulmonary vasoconstriction, inflammation,
CC allergies, asthma, impeded respiration, respiratory distress syndrome
CC (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
CC pulmonary transplantation rejection, pulmonary infections, bronchitis,
CC and/or cancer. AAF18434 to AAF21543 represent human polynucleotide
CC fragments and antisense oligonucleotides used in the exemplification of
CC the present invention

DR New nucleic acids that interact, and optionally cleave, target sequences,

XX used to treat cancer.

XX Claim 77; Page 79; 148pp; English.

PS The present invention describes nucleic acids (A) that interact stably

CC with a target sequence and contain at least one phosphoro(di)thioate
CC link, having endonuclease activity. (A), and more generally any catalytic
CC nucleic acid (A') that modulates expression of the oestrogen receptor
CC gene, are used to treat cancer (particularly of breast or endometrium),
CC in vivo or by transforming cells ex vivo and implanting treated cells, or
CC for other conditions associated with levels of oestrogen receptor.
CC Because of the high selectivity for targeted RNA, (A) can also be used to
CC correlate inhibition of gene expression with alterations in phenotype,
CC particularly for identification of therapeutic targets, and as research
CC reagents (for RNA, in the same way that restriction endonucleases are
CC used with DNA). The combination of modifications in (A) improves
CC resistance to nucleases, binding affinity and/or activity. AAA23503 to

PT Enzymatic and antisense nucleic acid inhibition of repressor genes,
PT useful for producing e.g. granulocyte colony stimulating factor protein,
PT interferon alpha and erythropoietin.
XX
PS Claim 37; Page 77; 164pp; English.
XX

CC The present invention relates to enzymatic and antisense nucleic acid
CC molecules that act as inhibitors of the expression of repressor genes
CC encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription
CC factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP).
CC Inhibition of the repressors removes prevents inhibition (and
CC consequently increases expression of) genes involved in the production of
CC erythropoietin, granulocyte colony stimulating factor protein and
CC interferon alpha

DR
XX Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense
PT constructs, which down regulate expression of a CD20 gene or neurite
PT growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
PT central nervous system injury.
XX
PS Claim 88; Page 99; 200pp; English.
XX
CC The invention relates to a nucleic acid molecule which down regulates
CC expression of a CD20 gene and a nucleic acid molecule which down
CC regulates expression of a neurite growth inhibitor gene (NOGO). The
CC nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a
CC DNzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule
CC possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) pr
CC an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA
CC with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA
CC of CD20 in the presence of a divalent cation that is preferably Mg²⁺.
CC Furthermore, it may be contacted with a cell to reduce CD20 activity of
CC the cell and treat a patient having a condition associated with the level
CC of CD20. The treatment may further comprise the use of one or more
CC therapies. In particular, the CD20 targetting nucleic acid may be used to
CC treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-
CC Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
CC leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
CC lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
CC immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-
CC targetting nucleic acid is used to cleave RNA of the NOGO gene in the
CC presence of a divalent cation that is preferably Mg²⁺. Furthermore, the
CC nucleic acid may be contacted with a cell to reduce NOGO activity of the
CC cell and treat a patient having a condition associated with the level of
CC NOGO. The treatment may further comprise the use of one or more
CC therapies. In particular, the NOGO-targetting nucleic acid may be used to
CC treat central nervous system (CNS) injury and cerebrovascular accident
CC (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),
CC chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),
CC Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob
CC disease, muscular dystrophy, and/or other neurodegenerative disease
CC states which respond to the modulation of NOGO expression. The present
CC sequence is a zinzyme molecule of the invention

Novel duplex useful in sequencing reactions, comprising an
oligonucleotide primer covalently coupled to a chromophore or fluorophore
so as to allow chain extension by a polymerase, and a template.

Disclosure; Fig 1A; 15pp; English.

The present invention describes a duplex comprising a template and a
primer joined to a chromophore or fluorophore to enable chain extension
by a polymerase. Also described is a method of sequencing a nucleic acid
using said primer, where the chromophore or fluorophore is used to
determine the sequence of the oligonucleotide. This is useful in sequence
analysis. The present sequence was used to demonstrate the method of the
invention

PT Identifying candidate therapeutic agents for treating body weight
PT disorders, comprises contacting test compound with cell expressing
PT mammalian obese receptor and reporter protein, and measuring expression
PT of reporter protein.
XX
PS Example; Col 119; 110pp; English.
XX
CC The present invention relates to novel obese (Ob) receptor (ObR) proteins
CC and polynucleotides encoding them. The invention relates to a method of
CC identifying candidate therapeutic agents to treat body weight disorder.
CC The method involves providing a cell which expresses a mammalian ObR on
CC the cell surface, binds leptin, the cell harbouring a reporter construct
CC comprising a sequence encoding a reporter protein, contacting the cell
CC with a test compound and measuring the expression of the reporter protein
CC in the presence of the test compound. The method is useful to identify an
CC agent, preferably a small molecule or antibody for the treatment of body
CC weight disorders such as obesity, cachexia, and anorexia. The present DNA
CC sequence is a PCR primer which is used for amplifying mouse ObR genomic
CC DNA. This sequence is used in the exemplification of the invention

PT New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins,
PT or as specific biomolecule capture probes for surface-enhanced laser
PT desorption ionization, comprises human myosin-like protein hGDMLP-1.
XX
PS Disclosure; SEQ ID NO 8568; 214pp; English.
XX
CC The present invention describes a human genome-derived myosin-like
CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-
CC 1 can be used in gene therapy and vaccine production. The hGDMLP-1
CC nucleic acids can be used as probes to detect, characterise and quantify
CC hGDMLP-1 nucleic acids in samples, as amplification substrates, to
CC provide initial substrates for the recombinant engineering of hGDMLP-1
CC protein variants having desired phenotypic improvements, and for
CC expressing the proteins. The hGDMLP-1 proteins or polypeptides may be
CC used as immunogens to raise antibodies that specifically recognise hGDMLP
CC -1 proteins, as standards in assays used to determine the concentration
CC and/or amount specifically of hGDMLP proteins, as specific biomolecule
CC capture probes for surface-enhanced laser desorption ionisation, as
CC therapeutic supplement in patients having specific deficiency in hGDMLP-1
CC production, and in vaccines or for replacement therapy. The
CC polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a
CC disorder associated with the expression of hGDMLP-1, in particular heart
CC and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
CC The present sequence represents an oligomer used in the screening of the
CC hGDMLP-1 sequence in the exemplification of the present invention. N.B.
CC The sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from WIPO

PT New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins,
PT or as specific biomolecule capture probes for surface-enhanced laser
PT desorption ionization, comprises human myosin-like protein hGDMLP-1.
XX
PS Disclosure; SEQ ID NO 9688; 214pp; English.
XX

CC The present invention describes a human genome-derived myosin-like
CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-
CC 1 can be used in gene therapy and vaccine production. The hGDMLP-1
CC nucleic acids can be used as probes to detect, characterise and quantify
CC hGDMLP-1 nucleic acids in samples, as amplification substrates, to
CC provide initial substrates for the recombinant engineering of hGDMLP-1
CC protein variants having desired phenotypic improvements, and for
CC expressing the proteins. The hGDMLP-1 proteins or polypeptides may be
CC used as immunogens to raise antibodies that specifically recognise hGDMLP
CC -1 proteins, as standards in assays used to determine the concentration
CC and/or amount specifically of hGDMLP proteins, as specific biomolecule
CC capture probes for surface-enhanced laser desorption ionisation, as
CC therapeutic supplement in patients having specific deficiency in hGDMLP-1
CC production, and in vaccines or for replacement therapy. The
CC polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a
CC disorder associated with the expression of hGDMLP-1, in particular heart
CC and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
CC The present sequence represents an oligomer used in the screening of the
CC hGDMLP-1 sequence in the exemplification of the present invention. N.B.
CC The sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from WIPO
CC at ftp.wipo.int/pub/published_pct_sequence

PT Novel isolated human testis expressed Patched like protein (HTPL), useful

PT for identifying agonist and antagonist and specific binding partners, and
PT for treating subjects having defects in HTPL.
XX
PS Example 2; Page 162; 718pp; English.
XX
CC The present invention relates to human testis expressed Patched like
CC protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL
CC has two isoforms, with a few single base pair differences between the
CC two. One of the single base pair changes introduces a premature stop
CC codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL
CC shares an overall structure organisation with the Patched protein. The
CC shared structural features strongly imply that HTPL plays a role similar
CC to that of Patched, and is a potential tumour suppressor. HTPL is
CC important in regulating male germ cell development, and the HTPL gene was
CC mapped to human chromosome 10p12.1. HTPL and its coding sequence are
CC useful for diagnosing a disorder caused by mutation in HTPL, and in
CC therapy and manufacture of a medicament for treatment or prevention of
CC such disorder associated with decreased expression or activity of human
CC HTPL. Such disorders include disorders of testis, or adrenal, adult and
CC foetal liver, bone marrow, brain, kidney, lung, placenta, prostate,
CC skeletal muscle or colon function. HTPL proteins and nucleic acids are
CC clinically useful diagnostic markers and potential therapeutic agents for
CC male infertility and cancer. The present oligonucleotide was used in an
CC example from the invention

XX Novel polynucleotide which down regulates expression of Ets-related gene,
PT useful for treating cancer, diabetic retinopathy, macular degeneration,
PT arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.
XX Claim 4; Page 74; 149pp; English.
PS The invention relates to a nucleic acid molecule (I) which down regulates
XX expression of an Ets-related gene (ERG). (I) is useful for treating
CC conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma,
CC tumour angiogenesis, diabetic retinopathy, macular degeneration,
CC neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca
CC vulgaris, angiofibroma of tuberos scleriosis, port-wine stains, Sturge
CC Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu
CC syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for
CC treating a patient having a condition associated with the level of ERG,
CC by contacting cells of the patient with (I) under conditions suitable for
CC the treatment. The method comprises the use of one or more therapies
CC under conditions suitable for the treatment. Leukaemia or tumour
CC angiogenesis is treated by administering (I) to the patient in
CC conjunction with one or more of other therapies such as radiation or
CC chemotherapy treatment. (I) is useful for reducing ERG activity in a
CC cell, by contacting the cell with (I). (I) is useful for cleaving RNA of
CC ERG gene, by contacting (I) with RNA, in the presence of a divalent
CC cation such as Mg2+. (I) is useful for diagnosis of conditions and
CC diseases related to the expression of ERG, and as diagnostic tool to
CC examine genetic drift and mutations within diseased cells or to detect
CC the presence of ERG RNA in a cell. (I) is useful for specifically
CC targeting genes that share homology with ERG gene or ERG fusion genes.
CC ABK17354-ABK22719 represent nucleic acids, including antisense and
CC enzymatic nucleic acid molecules which regulate expression of ERG, and
CC related PCR primers of the invention

PT Antibodies which selectively bind mammalian Ob receptors and inhibits the
PT binding of leptin to the mammalian Ob receptor, useful for diagnosing and
PT treating weight disorders.
XX
PS Example; Col 62; 108pp; English.
XX
CC The present invention relates to novel antibodies which selectively bind
CC mammalian Ob receptors (ObR) and inhibit the binding of leptin to the
CC mammalian Ob receptor. ObR sequences are novel receptor proteins that
CC participate in the control of mammalian body weight. The antibodies of
CC the invention may be used to detect of Ob receptor in a biological sample
CC and utilised as a part of diagnostic or prognostic technique in which
CC patients may be tested for abnormal amounts of Ob receptors. They may be
CC utilised in conjunction with, for example, compound screening schemes for
CC the evaluation of the effect of test compounds on expression and/or
CC activity of the Ob receptor gene product. The antibodies can be used in
CC conjunction with the gene therapy techniques, for example, to evaluate
CC the normal and/or engineered Ob receptor-expressing cells prior to their
CC introduction into the patient. They may be used in the method for the
CC inhibition of abnormal Ob receptor activity and can be used for drug
CC screening, clinical trial monitoring and/or the treatment of body weight
CC disorders including but not limited to obesity, cachexia and anorexia.
CC The present DNA sequence is a PCR primer which is used for amplifying
CC mouse ObR genomic DNA. This sequence is used in the exemplification of
CC the invention

PT and transfected cells.
XX
PS Disclosure; Page 40; 720pp; French.
XX
CC The invention relates to a novel isolated 17 mer nucleic acid sequence,
CC given in the specification, a sequence containing at least 15 consecutive
CC nucleotides from the 17 mer sequence, a sequence with, after optimal
CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that
CC hybridizes to them under highly stringent conditions, or the complement
CC of any of them, or the corresponding RNA. The novel isolated nucleic
CC acids of the invention are useful as probes and primers for detecting,
CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
CC component of a gene chip, in vitro as (anti)sense reagents, and for
CC production of recombinant polypeptides. Any of the nucleic acids,
CC polypeptides, vectors containing the nucleic acids, cells containing the
CC vector or antibodies directed against the polypeptides are useful for
CC preparation of pharmaceuticals for prevention and/or treatment of viral
CC diseases that are characterised by development of tumours or cell
CC degeneration, specifically cancer but also Alzheimer's disease and
CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
CC patient samples is useful for diagnosis and/or prognosis of these
CC diseases. The polypeptides can also be used to generate antibodies, and
CC both the polypeptide and antibodies are useful as components of protein

CC chips. The nucleic acid sequences of the invention can be used in gene
CC therapy. This polynucleotide sequence represents a tumour suppression
CC related human fukutin oligonucleotide of the invention

PT New isolated nucleic acid, useful for treating viral diseases associated
PT with tumors and cell degeneration, also related polypeptides, antibodies
PT and transfected cells.
XX
PS Disclosure; Page 604; 720pp; French.
XX
CC The invention relates to a novel isolated 17 mer nucleic acid sequence,
CC given in the specification, a sequence containing at least 15 consecutive
CC nucleotides from the 17 mer sequence, a sequence with, after optimal
CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that
CC hybridizes to them under highly stringent conditions, or the complement
CC of any of them, or the corresponding RNA. The novel isolated nucleic
CC acids of the invention are useful as probes and primers for detecting,
CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
CC component of a gene chip, in vitro as (anti)sense reagents, and for
CC production of recombinant polypeptides. Any of the nucleic acids,
CC polypeptides, vectors containing the nucleic acids, cells containing the
CC vector or antibodies directed against the polypeptides are useful for
CC preparation of pharmaceuticals for prevention and/or treatment of viral
CC diseases that are characterised by development of tumours or cell
CC degeneration, specifically cancer but also Alzheimer's disease and
CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
CC patient samples is useful for diagnosis and/or prognosis of these
CC diseases. The polypeptides can also be used to generate antibodies, and
CC both the polypeptide and antibodies are useful as components of protein
CC chips. The nucleic acid sequences of the invention can be used in gene
CC therapy. This polynucleotide sequence represents a tumour suppression
XX related human fukutin oligonucleotide of the invention

PT Novel enzymatic nucleic acid molecules which down regulates expression of
PT a sequence encoding a subunit of nuclear factor kappa B useful for
PT treating cancer, inflammatory disorders and autoimmune diseases.
XX
PS Claim 3; Page 29; 72pp; English.
XX
CC The invention describes an enzymatic nucleic acid molecule (I) which down
CC regulates expression of a sequence encoding a subunit of nuclear factor
CC kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme
CC configuration. The enzymatic nucleic acid molecule is adapted to treat
CC cancer and is useful for down-regulating REL-A activity in a cell, for
CC treating a patient having a condition associated with the level of REL-A.
CC (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in
CC the presence of a divalent cation, especially Mg²⁺. The enzymatic and
CC antisense nucleic acid molecules are useful for treating breast, lung,
CC prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic,
CC cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or
CC multidrug resistant cancer. The method involves use of other drug
CC therapies such as monoclonal antibodies, REL-A-specific inhibitors or

CC chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate,
CC cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate,
CC gemcitabine or radiation therapy. The enzymatic and antisense nucleic
CC acid molecules are also useful for treating inflammatory disease such as
CC rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes,
CC obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft
CC rejection, gene therapy applications, ischaemia/reperfusion injury
CC (central nervous system (CNS) and myocardial), glomerulonephritis,
CC sepsis, allergic airway inflammation, inflammatory bowel disease or
CC nucleic acid molecule

DR Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

XX Claim 3; Page 30; 72pp; English.

CC The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg²⁺. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, gemcitabine or radiation therapy. The enzymatic and antisense nucleic

CC acid molecules are also useful for treating inflammatory disease such as
CC rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes,
CC obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft
CC rejection, gene therapy applications, ischaemia/reperfusion injury
CC (central nervous system (CNS) and myocardial), glomerulonephritis,
CC sepsis, allergic airway inflammation, inflammatory bowel disease or
CC infection. This sequence represents the substrate of a novel enzymatic
XX nucleic acid molecule

PS Example 8; SEQ ID NO 690; 103pp; English.
XX
CC The present invention relates to novel human zinc finger-containing
CC proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is
CC encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
CC MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC or in manufacturing a medicament for treating or preventing a disorder
CC associated with decreased or increased expression or activity of MDZ3,
CC MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC acids and proteins are also useful for diagnosing or monitoring a disease
CC caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC acids can also be used as probes to detect and characterize gross
CC alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC useful in constructing microarrays for measuring gene expression. The
CC proteins are useful as therapeutic agents for gene therapy or as
CC vaccines. The present sequence was used to illustrate the invention.

XX

The present invention relates to nucleic acid molecules which modulate
CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
CC and enzymatic nucleic acids such as hammerhead ribozymes, DNzymes,
CC inozymes, zinzymes, amberyne, and G-cleaver ribozymes. Also disclosed
CC are nucleic acid decoy molecules and aptamers that bind to HBV reverse
CC transcriptase and/or HBV reverse transcriptase primer sequences, as well
CC as oligonucleotides that specifically bind the Enhancer I region of HBV
CC DNA. The nucleic acids may be used to modulate the expression of HBV
CC genes and HBV viral replication. Also disclosed is a method for screening
CC compounds and/or potential therapies directed against HBV, and compounds
CC that modulate the expression and/or replication of HCV. The compounds and
CC methods of the invention are useful for the treatment of degenerative and
CC disease states related to HBV and HCV infection, replication and gene

PS The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in vitro as (anti)sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia

CC      The invention relates to the isolation of 6327 nucleotide sequences,
CC      fragments of at least 15 consecutive nucleotides of these nucleotides, a
CC      sequence having at least 80% identity, after optimal alignment, with the
CC      nucleotides, a sequence that hybridizes under stringent conditions with
CC      the nucleotides, or the complement, or corresponding RNA, of the
CC      nucleotides. The nucleotides are used as probes or primers for detecting,
CC      identifying, quantifying and/or amplifying nucleic acids, as in vitro
CC      sense and antisense sequences, of nucleotides involved in tumour
CC      suppression or reversion, apoptosis and or viral resistance, to produce
CC      recombinant polypeptides, and to prepare transgenic animals, as
CC      experimental models. The nucleotides (also vectors containing them and
CC      cells containing the vectors), the encoded polypeptides and antibodies
CC      (Ab) against the polypeptide are useful for prevention and/or treatment
CC      of viral infections or diseases characterized by development of tumours
CC      or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
CC      Analysis of the expression of the nucleotides can be used for diagnosis
CC      and/or prognosis of these diseases. The nucleotides and polypeptides can
CC      also be used to screen for their specific interactive molecules,
CC      potentially useful for treating diseases associated with abnormal
CC      expression of the nucleotides.

PT New isolated or recombinant polypeptide for use in modulating a plant
PT growth trait in a flowering plant e.g. in Arabidopsis, Brassica, Zea, or
PT Oryza.
XX
XX
PS Example 2; SEQ ID NO 196; 81pp; English.
XX
XX
CC The invention describes an isolated or recombinant polypeptide (I)
CC comprising a sequence: (a) comprising 1 of 30 sequences (S1), as given in
CC the specification, or a conservative variant; (b) encoded by 1 of 30
CC sequences (S2), as given in the specification, or a conservative variant;
CC (c) encoded by a sequence that hybridises under stringent conditions to
CC S2; and (d) encoded by a sequence 70 % identical to S2. The expression or
CC activity of (I) is modulated to modulate a plant growth trait in a
CC flowering plant, of the family Brassicaceae, preferably in a plant that
CC is Arabidopsis, Brassica, Zea, Oryza, Triticum, Hordeum, Lolium, Sorghum,
CC Glycine, Medicago, Helianthus, Lactuca, Beta, Vitis, Solanum,
CC Lycopersicon, Capsicum, Gossypium, Hevea, Linum, Prunus, Citrus, Populus,
CC Pinus, or Quercus. A new method is used to detect genes for a plant
CC growth trait. This sequence represents a polynucleotide isolated from the
CC plant growth associated genes of the invention that can be used a
CC primer, probe or genetic marker.

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 9413; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

XX Novel enzymatic nucleic acid that down-regulates expression of neurite
PT growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or
PT protein kinase PKR genes, for treating cancer and inflammatory disease.
XX
PS Claim 59; SEQ ID NO 2937; 317pp; English.

XX The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor
CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
CC invention are useful for treating: cerebrovascular accident, central
CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC disease, lupus, multiple sclerosis, transplant/graft rejection,
CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC nucleic acids of the invention are also useful for down-regulating the
CC expression of a target gene and as a diagnostic tool to examine genetic
CC drifts and mutations within diseased cells or to detect the presence of a
CC target RNA in a cell. The present RNA sequence represents a human PKR
CC substrate sequence.

PS Claim 59; SEQ ID NO 2936; 317pp; English.
XX
XX The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor
CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
CC invention are useful for treating: cerebrovascular accident, central
CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC disease, lupus, multiple sclerosis, transplant/graft rejection,
CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC nucleic acids of the invention are also useful for down-regulating the
CC expression of a target gene and as a diagnostic tool to examine genetic
CC drifts and mutations within diseased cells or to detect the presence of a
CC target RNA in a cell. The present RNA sequence represents a human PKR
CC substrate sequence.

PS Claim 4; SEQ ID NO 440; 74pp; English.
XX
CC The invention relates to a nucleic acid molecule that down-regulates
CC expression of Grb2-related with insert domain (GRID) gene, e.g. a
CC hammerhead ribozyme, NCH ribozyme, G-cleaver ribozyme, Zinzyyme, DNazyme,
CC amberzyme, inozyme or hairpin ribozyme. Also include are a mammalian cell
CC including the novel nucleic acid molecule, reducing GRID activity in a
CC cell by contacting the cell with the novel nucleic acid molecule,
CC treating a patient having a condition associated with the level of GRID
CC (e.g. tissue/graft rejection or leukaemia) by contacting the cell with
CC the novel nucleic acid molecule, cleaving RNA of a GRID gene by
CC contacting the cell with the novel nucleic acid molecule, an expression
CC vector comprising a nucleic acid sequences (encoding at least the novel
CC nucleic acid molecule in a manner that allows its expression), a
CC mammalian cell including the expression vector and an enzymatic nucleic
CC acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid
CC molecule is useful for treating a condition associated with the level of
CC GRID, e.g. tissue/graft rejection and leukaemia. The present sequence is
CC a target region for the enzymatic nucleic acids of the invention.

XX
XX Pharmaceutical composition for treating asthma, has antisense
PT oligonucleotide containing less percentage of adenosine, targeted to
PT nucleic acids associated with lung airway or lung dysfunction, and
PT bronchodilating agent.
XX
PS Claim 15; SEQ ID NO 9413; 763pp; English.
XX
CC This invention describes a novel composition (a) a first active agent,
CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

CC rejection and diagnosing and treating T-cell associated diseases
CC including autoimmune diseases, degenerative nervous system diseases,
CC graft versus host disease, hypersensitivity diseases, infectious diseases
CC and neoplastic diseases. Autoimmune diseases include Addison's disease,
CC atrophic gastritis. Degenerative nervous system diseases include multiple
CC sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type
CC I hypersensitivities such as contact with allergens that lead to
CC allergies, Type II hypersensitivities such as those present in
CC Goodpasture's syndrome and Type IV hypersensitivities such as those
CC manifested in leprosy. Infectious diseases include viral infections
CC caused by viruses such as HIV, fungal infections such as those caused by
CC the yeast genus Candida, parasitic infections such as those caused by
CC schistosomes, filaria and bacterial infections such as those caused by
CC Mycobacterium. Neoplastic diseases include lymphoproliferative diseases
CC such as leukaemias, lymphomas and cancers such as cancer of the brain,
CC breast. The present sequence represents a Vbeta gene repeat sequence.

PT Novel myosin-like protein-1, useful for treating or preventing disorder
PT associated with decreased expression or activity of human genome-derived
PT myosin-like protein-1 such as disorder of heart and/or skeletal muscle
PT function.
XX
PS Disclosure; SEQ ID NO 9687; Opp; English.
XX
CC The invention relates to a novel polypeptide (I) comprising a sequence
CC (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully
CC defined in the specification, a fragment of at least 8 amino acids of
CC (S1), 95% deviation from (S1) which are conservative substitutions, and
CC 65% identity to (S1). A polypeptide of the invention acts as a agonist or
CC antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A
CC pharmaceutical composition of the invention is useful for treating or
CC preventing a disorder associated with decreased expression or activity of
CC hGDMLP-1, such as a disorder of heart and/or skeletal muscle function.
CC The present sequence represents a 17-mer nucleotide, used in the
CC invention for scanning the sequence represented in ACN63103

PS Claim 17; Page 15; 162pp; English.
XX
CC The present invention describes an isolated human period (Drosophila)
CC homologue 1, (PER1) polynucleotide (I) comprising a sequence which is a
CC polymorphic variant for a reference sequence (ABL52077) for the PER1 gene
CC or its fragment, or a polymorphic variant of a reference sequence
CC (ABL52078) for a PER1 cDNA or its fragment. The present invention also
CC describes methods for genotyping and haplotyping the PER1 gene of an
CC individual. (I) is useful in studying the expression and function of
CC PER1, and in expressing PER1 protein for use in screening for candidate
CC drugs to treat diseases related to PER1 activity. (I) is useful for
CC therapeutic purposes. A recombinant non-human organism transformed or
CC transfected with (I) can be used for studying expression of the PER1
CC isogenes in vivo, for in vivo screening and testing of drugs targeted
CC against PER1 protein, and for testing the efficacy of therapeutic agents
CC and compounds for disorders associated with circadian rhythm regulation.
CC The present sequence represents an allele specific oligonucleotide primer
CC for human PER1, which is used in the exemplification of the present
CC invention

XX New genetic variants of Glutathione reductase isogenes, useful for
PT improving efficiency and reliability in drug development for treating
PT hemolytic anemia.
PT
PS Claim 14; Page 14; 137pp; English.
XX
CC The present invention describes genetic variants of the human glutathione
CC reductase (GSR) gene (I). (I) has antianaemic activity and can be used in
CC gene therapy. (I) can be used in screening for drugs targeting (I) that
CC are useful for treating haemolytic anaemia. Methods from the present
CC invention can be used; for improving the efficiency and reliability of
CC several steps in the discovery and development of drugs for treating
CC diseases associated with GSR activity; for haplotyping, which is also
CC used by the pharmaceutical research scientist to validate GSR as a
CC candidate target for treating a specific condition or disease predicted
CC to be associated with GSR activity, e.g. haemolytic anaemia, and in the
CC design of clinical trials for treating a specific condition of disease
CC associated with GSR activity; and for screening compounds targeting GSR.
CC (I) is useful in studying the expression and function of GSR, and in
CC expressing GSR protein for use in screening for candidate drugs to treat
CC diseases related to GSR activity. (I) is also useful in studying the
CC effect of the variation on the biological activity of GSR as well as on
CC the binding affinity of candidate drugs targeting GSR for the treatment
CC of haemolytic anaemia. The present sequence represents an allele specific
CC oligonucleotide (ASO) primer for the human GSR gene, which is given in
CC the exemplification of the present invention. N.B. The polymorphic base
CC (showing a single nucleotide polymorphism) in the ASO primer is shown
CC using an IUPAC ambiguity code (as given in the present invention)

XX PT New polymorphic variants comprising interleukin-8 receptor beta (IL8RB)
PT isogene, useful in expressing IL8RB protein for use in screening for
PT candidate drugs to treat diseases related to IL8RB activity, e.g.
PT inflammatory disorders.
XX PS
XX PS Claim 16; Page 13; 74pp; English.
XX CC The invention relates to single nucleotide polymorphisms in the human
CC interleukin 8 receptor beta (IL8RB) gene. A method for haplotyping the
CC IL8RB gene in an individual comprises identifying the nucleotide at one
CC or more polymorphic sites and determining whether one of the copies of
CC the gene is defined by one of the IL8RB haplotypes given in the
CC specification or whether both copies are defined by a haplotype pair.
CC This method is useful in genotyping, whereby all possible haplotype pairs
CC a haplotype or haplotype pair of the IL8RB gene can be identified by
CC comparing the frequency of the haplotype or haplotype pair in a
CC population exhibiting the trait with the frequency of the haplotype or
CC haplotype pair in a reference population, where a higher haplotype
CC frequency in the trait population indicates the trait is associated with
CC the haplotype or haplotype pair. IL8RB and its corresponding DNA are used
CC for studying the expression and function of IL8RB, for use in screening
CC for candidate drugs to treat diseases related to IL8RB activity, such as
CC chronic obstructive pulmonary disease and other inflammatory disorders.
CC The sequences are also useful for studying the effect of variation on the
CC biological activity of IL8RB as well as on the binding affinity of
CC candidate drugs targeting IL8RB. Sequences AAS95525-AAS95579 represent
CC allele-specific oligonucleotide probes, sequencing primers and PCR
XX primers used to detect IL8RB gene polymorphisms

PT polymorphic variants, useful e.g. in studying the expression and function
PT of APPBP1 and screening candidate drugs for treating Alzheimer's disease.
XX
XX PS Claim 17; Page 13; 104pp; English.
XX CC The invention relates to an isolated polypeptide comprising a sequence
CC which is a polymorphic variant of a reference sequence for the amyloid
CC beta precursor protein binding protein 1, 59kD (APPBP1) protein or its
CC fragment. The polymorphic variants are useful in studying the expression
CC and function of APPBP1, in expressing APPBP1 protein for use in screening
CC for candidate drugs to treat diseases related to APPBP1 activity, in
CC studying the effect of the variation on the biological activity of
CC APPBP1, and the binding affinity of candidate drugs targeting APPBP1 for
CC the treatment of disorders such as Alzheimer's disease. The haplotyping
CC methods are useful in validating APPBP1 as a candidate target for
CC treating a specific condition or disease predicted to be associated with
CC APPBP1 activity, or in the design of clinical trials of candidate drugs
CC for treating a specific condition or disease associated with APPBP1
CC activity. The transgenic animals are useful for studying expression of
CC the APPBP1 isogenes in vivo, for in vivo screening and testing of drugs
CC targeted against APPBP1 protein, and for testing the efficacy of
CC therapeutic agents and compounds for disorders related to platelet
CC aggregation in a biological system. ABK32771-ABK32327 represent human
